Welcome

Dear Mississippi Public Health Laboratory Customer:

Our laboratory is pleased to provide you with the most recent version of our services guide. We have designed the guide to give you the latest information on all the tests performed by our laboratory. The guide also provides a brief overview of the laboratory organization, contact information, and our procedures for the submission, collection, and handling of specimens. Our guide also includes quick reference charts and diagrams that can be printed to assist you with collecting and submitting specimens. We have included a list of forms for submitting specimens. Thank you for your continued support of our laboratory.

Sincerely,

Daphne Ware, Ph.D.
Director, Mississippi Public Health Laboratory
General Information

Mississippi Public Health Laboratory
570 E. Woodrow Wilson Drive
Jackson, MS 39216
Telephone: 601-576-7582
FAX: 601-576-7720
After Hours and Holidays phone: 601-576-7400

Hours of Operation
Normal business hours are from 8:00 am to 5:00 pm, Monday through Friday.

Holiday Schedule
The Mississippi Public Health Laboratory follows Department of Health policy for holiday operation. Please consider this when submitting time-limited specimens, such as milk and water, during holiday periods.

Web Address:
http://msdh.ms.gov/msdhsite/_static/14,0,188.html

Directions to the MPHL
The MPHL is located at the Dr. F.E.”ED” Thompson, JR Public Health Laboratory Facility on the MSDH’s central office campus in Jackson, MS.

To Visit MPHL:
Take I-55 to the Woodrow Wilson Exit. After passing through North State Street (2nd red light), turn right into the 1st MSDH entrance off Woodrow Wilson Drive. Immediately after entering the MSDH campus, park in one of the spots labeled as “Visitor”. Walk up the left sidewalk that is directly in front of the Thompson Laboratory. Turn and walk up the ramp to the front of the Thompson Building. The Thompson Laboratory entrance is identified with a yellow star. Additional visitor parking is available on the 1st floor of the parking garage. Samples may be delivered at the Thompson Laboratory dock, identified with a white star.

Laboratory Organization

The Mississippi Public Health Laboratory (MPHL) is organizationally located under the Office of the State Health Officer of the Mississippi State Department of Health (MSDH). The mission of the MPHL is to provide quality environmental and clinical testing services for the diagnosis, prevention and surveillance of infectious and chronic diseases and environmental contaminates to reduce the incidence of illness and death and to improve the quality of life among Mississippians. MPHL testing and support functions are arranged into three different service areas that are under the administration of the laboratory director. Each service area is identified in the table below with associated sections shown beneath.

**Administrative Services**

The administrative services area provides laboratory support services that include financial, human resources, and logistical components. This service area is responsible for records management and maintenance of the Laboratory Information Management System (LIMS). This service area manages all funding, purchasing, and billing activities associated with the laboratory. Additionally, the administrative services area provides training opportunities for private laboratories throughout the state for emergency response preparedness.

**Clinical Laboratory Services**

The clinical services area offers analyses of clinical samples in support of the MSDH program requirements and the agency mission of public health surveillance. In addition to testing clinical samples, the clinical services area also performs testing on food products associated with infectious disease outbreaks and environmental samples associated with suspected bioterrorism events. The MPHL participates in the College of American Pathologists, Wisconsin State Lab of Hygiene, American Association of Bioanalysts, American Proficiency Institute and Centers for Disease Control proficiency testing programs. The MPHL is certified to provide clinical laboratory services by the Center of Medicare and Medicaid Services through compliance with the Clinical Laboratory Improvement Amendments of 1988 (CLIA). All clinical test requests must be authorized by a licensed physician or nurse practitioner and must be submitted by a client approved to submit the requested test. Test orders require the submission of a MPHL test requisition and must include the submitter, patient, and specimen information. When medically indicated, rabies testing of animals is available to all Mississippi residents at no cost by the clinical services section. (See Appendix C for complete information.)

**Environmental Laboratory Services**

The environmental services area provides comprehensive analyses of drinking water for various chemical and/or physical parameters as well as for the presence of bacteriological agents. Public and private water
system samples are submitted through the MSDH Bureau of Public Water Supply. The area also provides bacteriological and chemical analysis for raw milk and dairy products produced within the state. These analyses help verify that Mississippi dairy products are in compliance with state and federal standards. The environmental services area participates in the Environmental Protection Agency (EPA) Drinking Water Certification Program and the Food and Drug Administration (FDA) Dairy Lab Evaluation Program. The MPHL is a member of the Environmental Response Laboratory Network (ERLN). The ERLN is the Environmental Protection Agency’s (EPA) national network of laboratories that can be accessed as needed to support large scale environmental responses.

**Outreach Services**
The Outreach services area coordinates the state laboratory network and promotes statewide sentinel laboratory communication. The area assists with coordinating biological and chemical laboratory response network activities within the State of Mississippi. This service area assists hospital sentinel laboratories by providing training and support in specimen collection, storage, and shipment, evidence-control measures and recognition of chemical and biological terrorism agents. This area also provides biosafety expertise and is available to assist all clinical laboratories in laboratory biosafety by providing training, risk assessments and mitigation strategies. The outreach services area oversees the MPHL’s safety and training programs.

**Emergency Response Capability**
The MPHL has been pro-active in terrorism preparedness since 1999. The laboratory has trained response teams that are available 24/7 to perform chemical and biological agent testing. The MPHL is a member of the Laboratory Response Network Biological (LRN-B) and Laboratory Response Network Chemical (LRN-C). The LRN is an integrated national and international network of laboratories that are able to quickly deploy rapid testing, timely notification and secure messaging of results associated with acts of biological or chemical terrorism and other high priority public health emergencies. The MPHL is designated as a LRN Reference Laboratory for biological and Level 2 chemical threat agents. The laboratory has rapid response molecular testing capabilities to aid law enforcement in identifying specimens that may pose a threat to the citizens of our state.

**Quality Assurance**
The MPHL has an extensive internal quality assurance program that defines and implements the quality tools required for monitoring and improving the quality of services provided at the laboratory. The quality assurance unit encompasses both clinical and environmental laboratory service functions. The quality assurance program provides the following services: review of federal regulations for guidance and compliance; monitor laboratory performance to assess potential problems and ensure quality laboratory testing; develop, evaluate, and standardize laboratory processes and tools; as well as resolve customer service issues relating to laboratory service. Complaints or suggestions for quality improvement can be made by phone directly to the Quality Assurance Office or in a written format addressed to the attention of the Quality Assurance Office.

**Laboratory Service Policy and Limitations**
Certain clinical and environmental services are available only to the Department of Health. Some tests are limited to patients in specific health department programs. Other tests are performed on a fee-for-service basis for non-health department sources. Although routine diagnostic testing in all areas cannot be provided outside the health department system, private physicians, hospitals, and laboratories are encouraged to contact the laboratory regarding special cases or emergency matters.
Samples must be submitted through a local health department, physician, water system or other authorized submitter. Private citizens are authorized to submit drinking water samples for metal or microbiology testing for a fee.

The report of results is sent to the authorized submitter of the specimen. Certain results are furnished to MSDH programs for follow-up, compliance, or epidemiologic purposes. The patient or their designated personal representative can request a copy of their completed laboratory results. For privacy protection, the laboratory will require proof of identity prior to issuing the test results. This request must be made in writing on form AS0-1, MPHL Patient Request for Release of Completed Laboratory Results, located at https://msdh.ms.gov/msdhsite/_static/resources/6517.pdf.

The MPHL, in collaboration with public health officials, reserves the right to withdraw services in the case of misuse or improper specimen submission. The services offered by the MPHL are in accordance with Department of Health policies, licensure requirements, and mission.

**Record Retention**
The MPHL clinical services retains all test requisitions and patient test results at a minimum for the retention period required to comply with and adhere to the CLIA. The MPHL environmental services retains all sample testing data at a minimum for the retention period required to comply and adhere to the FDA and the EPA. A copy of the original report can be reconstructed including reference ranges, interpretive comments, flags, and footnotes by the MPHL upon request.

**Referral of Tests to Another Laboratory**
The MPHL forwards tests to other laboratories as a service to its clients. If a specimen is sent to a reference laboratory for initial, follow-up or verification testing by the Mississippi Public Health Laboratory, the sender will be notified that the specimen has been referred. The original result report from the reference laboratory is forwarded or faxed to the sender or the result is reported by the MPHL as a part of the specimen report, with the reference laboratory identified as the testing laboratory. Copies of all reports are maintained by the MPHL.

**Confirmatory Testing**
When confirmatory tests are necessary, patient results are not released until all testing is completed.

**Sample Submission and Shipment**
The MSDH operates a state-wide courier system for clinical and environmental sample shipment to the MPHL. The MSDH courier system transports samples from local health departments daily and delivers the samples to the MPHL directly. Samples must be properly collected and packaged in accordance with all Department of Transportation (DOT) regulations prior to delivery to a local Health Department. The local Health Department staff is not responsible for packaging external samples or providing shipping supplies. Refer to Appendix E for shipping guidelines. Please contact your local health department for additional guidance on sample submission to the MPHL through the MSDH courier.

Samples from local clients may be dropped off directly at the MPHL. Refer to Appendix Q for delivery instructions.

**Obtaining MPHL Services**
To set-up a new account, contact the MPHL Administrative Services Director at (601)576-7582 or (601)576-7745. After account set-up, clients will be provided with supply ordering information and test reporting options.
Billing Information
Tests are billed quarterly to all non-MSDH clients through mailed invoices. Full payment is due 45 days from date of invoice for all lab services. Prices for all testing services and supplies are reviewed annually and updated, as necessary. Clients will receive notification of all price changes prior to enforcement.

Delivery of Specimens and Samples

State Courier Services: Specimens may be dropped off at a local MSDH clinic Monday- Friday (except holidays) for overnight delivery to the MPHL. Contact your local MSDH clinic prior to dropping off a specimen to confirm the clinic’s hours of operation. If an alternate MSDH drop-off location is required, contact the MSDH Office of Field Services at 601-576-7951 for assistance. Specimens arriving on weekends are stored appropriately for testing to begin on the following weekday.

Delivery in Person: Monday-Friday, 8am-4:30 pm.
Specimens may be delivered directly to the UPS, FedEx, and private courier: Monday through Friday, 8am-4:30pm.

Environmental samples for agents of Bioterrorism (BT) must be delivered in person by law enforcement agents or MSDH Office of Emergency Preparedness staff. Clinical isolates/specimens are typically delivered by private courier.

A refrigerated temperature range is between 2-8 °C (35.6°-46.4°F).
Clinical Services

Specimen Collection and Submission

Specimen Collection
Review the specimen requirements for the desired test(s). Use only the specimen containers specified and the collection techniques provided by this manual.
• Collection devices and containers must be within the expiration date stated by the manufacturer.
• Samples submitted in leaking containers cannot be tested.
• Collect the appropriate volume of sample required for desired test(s).

Specimen Labeling
All specimens should be labeled at the time of collection with at least 2 patient identifiers that must also appear on the requisition.
1. The patient’s name (full last name, then full first name) is always required. The patient’s first and last name must be recorded exactly as it appears in the patient chart; do not use nicknames. If a label is used, ensure that it is completely attached to the specimen for accurate identification.
2. The second patient identifier may be one of the following:
   • Patient’s Date of birth (month/day/year)
   • Other unique patient identifier, e.g., hospital or office ID code, file number or Medical Record Number
   • Patient’s Social Security Number

NOTE: Location-based identifiers are NOT acceptable, e.g., hospital room number or street address. Each specimen must have a securely affixed label with the following information:
• The patient’s name written exactly as it appears on the test requisition (e.g., Doe, Jane)
• A second patient identifier as noted above.

If the label is handwritten, use a ballpoint pen. Do not use a felt tip pen. If glass slides are submitted, use a pencil for labeling the frosted end. Two identifiers are preferred, although patient’s name alone is acceptable. When submitting a specimen in a container other than the tube used to draw the sample (e.g., transfer vials), also indicate specimen type on the label (e.g., serum, plasma, urine). When submitting specimens for microbiological testing (e.g., cultures, bacterial antigen, microscopic examination), the nature and anatomic source of the sample and the specific organism(s) to be detected, if any, should be specified.

Test Requisition
Specimens must be accompanied by a paper requisition, prepared either by hand or printed as a PDF. Please select the appropriate requisition form for each test desired.
At a minimum, the requisition should contain the following information:
• Adequate patient identification (e.g., name, address, telephone number, medical record number)
• Submitter information.
• Patient gender
• Patient date of birth, or age
• Name and address of clinic/submitter ordering the test
• Test(s) requested
• Date of specimen collection
• Collection time, if requested
• Source and type of specimen and time of collection, when appropriate
• Clinical information, when appropriate complete the “Patient Epidemiological Information” section on the requisition.
• Document the test to be performed if not specifically identified on the test requisition.

Specimens that are unlabeled or improperly labeled will be rejected. Specimens received without submitter information will be rejected.

The patient identification information on the specimen and requisition must match. Laboratory tests will only be performed if the specimen container is labeled with the correct patient identification information and if the information on the container label exactly matches the requisition.

Clinical Specimen Shipment
1. Package each clinical specimen in a separate transport bag containing an absorbent pad, placing the specimen in the zip lock portion of the bag and the requisition in the outside pocket. Ensure that the test requisition is placed in the pouch so that the test and patient information is facing outward.
2. Do not place specimens for multiple tests in the same bag.
3. Prior to shipment, ensure that all specimen transport bags are securely fastened.

All samples shipped through the MSDH courier system must be placed in an MPHL-supplied shipping container at the Department of Health facility. See Appendix E for detailed shipping information.

Please note that some laboratory procedures require the approval of the Epidemiology Office or other agency program offices. MSDH representatives may be reached Monday through Friday 8am to 5pm at 601-576-7725 or 601-576-7400 on nights and weekend for approval.

Reporting
The report of testing results is sent to the authorized submitter of the clinical specimen, as designated on the test requisition. Copies of clinical laboratory results may be furnished to another authorized submitter upon request of the initial authorized submitter. Certain results are furnished to public health programs for follow-up or epidemiologic purposes.

Reports are faxed to submitters enrolled in automatic fax reporting or can be accessed and printed daily by approved submitters through the internet via the MPHL clinical services web portal. Reports are mailed daily to submitters that are not enrolled in fax or web-based reporting through the Department of Health courier system or the Postal Service. The MPHL is also capable of submitting test results to all clients electronically using an HL7 message. To set-up electronic reporting, the MPHL will actively work with each client’s software vendor and staff to develop an interface solution. The MPHL is committed to industry and regulatory standards for data transmission including HL7, LOINC, and SNOMED. Submitters are notified by the result reporting process of unsatisfactory or rejected samples. Unsatisfactory samples are appropriately discarded and cannot be returned. Submitters will be notified by telephone of any critical test values and corrected test reports. See each individual test description for a list of appropriate critical test values.
Disease Reporting
The MPHL complies with the MSDH Reportable Disease regulation as required in the Mississippi Code of 1972, Section 41-3-1. For a complete listing of reportable diseases, please visit the MSDH website at www.msdh.state.ms.us.

Correcting Reporting Errors
If a reporting error is discovered by the MPHL after results have been mailed or accessed through a result point, the submitter will be notified immediately by telephone of the error and the correct result. A corrected report will be issued that contains the statement “corrected report” and a comment documenting the telephone notification process. If a data entry error is discovered by the MPHL after a report has been mailed or accessed through a result point, the report will be corrected immediately and any potentially affected results will be re-verified to assure that the demographic change did not alter the result and to assure reference ranges are correct.

Submitters should immediately notify the laboratory of any observed reporting errors. Submitter-identified errors will be corrected, and a corrected report will be released.
### Common Unsatisfactory Clinical Specimen Causes and How to Prevent Rejections

<table>
<thead>
<tr>
<th>Rejection Statement</th>
<th>How to Prevent</th>
</tr>
</thead>
</table>
| No patient identifier on specimen or No name on specimen | Specimen identifying label or notation is not attached to collection device. Each specimen must be labeled to ensure correct identification of patient/sample.  
*Mismatched and missing identifiers are the primary cause for specimen rejection.* |
| Name (identifier) on specimen does not match request form | Verify that the patient information on the sample container/tube matches the information on the requisition exactly. If possible, allow a coworker to verify that the information on both matches as well.  
*Mismatched and missing identifiers are the primary cause for specimen rejection.* |
<p>| No submitter listed on test requisition                  | Label test requisition legibly with submitter name and address.               |
| Specimen identification illegible.                       | Label specimen legibly by writing clearly on the specimen or by applying a label containing patient information that is written or typed clearly. |
| No specimen received                                      | Be careful to include specimen in transport bag. Verify that transport bag is securely sealed prior to shipment. |
| Quantity not sufficient                                   | Specimen volume did not meet minimum volume requirements. Check minimum sample requirements before beginning venipuncture. Assure that an adequate sample has been obtained before dismissing the patient. Quantity Not Sufficient (QNS) samples cannot be processed. |
| Specimen leaked, damaged, or crushed in transit          | The specimen was damaged during shipment. Add packing material to secure specimens as needed in shipping container. |
| Specimen too old when received                           | MPHL has specific time requirements for tests. Follow all specimen receipt requirements defined in this guide. |
| Specimen too old for analysis                            | MPHL-specified collection device had exceeded manufacturer expiration date. Obtain in-date collection devices and recollect/resubmit the specimen. |
| Specimen submitted in an expired collection tube/container. | MPHL only accepts specific collection devices for certain tests. Obtain the appropriate collection device and recollect/resubmit the specimen. |
| Specimen submitted in the wrong kind of tube or device.  | Clotting may occur at the time of collection; a specimen does not clot as it ages. To avoid clotting of a venous specimen, perform the following: Mix collection device immediately after collection for at least 2 minutes. Ensure that blood comes in contact with the entire inner surface of the tube. |</p>
<table>
<thead>
<tr>
<th>Specimen grossly hemolyzed Or Specimen rejected due to severe hemolysis.</th>
<th>For difficult venipunctures, never use anything smaller than a 21 gauge needle. RBCs are fragile and will burst if too much pressure is applied by small needles. Draw samples by slow, steady pressure. Too much pressure will either burst the RBCs causing the sample to be “hemolyzed” or cause the vein to collapse in on itself and stop the blood flow. Hemolysis is defined as breakage or rupture of the red cell membrane allowing the release of hemoglobin and other cellular fluids into the surrounding fluid.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specimen not centrifuged correctly</td>
<td>Have a blood tube rack in the phlebotomy area. Blood tubes with gel type separator need to clot in the <strong>upright</strong> position before centrifugation to ensure a good plug is produced prior to transportation. Place tubes upright in racks as they are collected. A more secure and properly positioned gel plug helps keep cellular components i.e. red cells, from washing back into serum while in transit and reduces the number of samples rejected as “not centrifuged correctly”.</td>
</tr>
<tr>
<td>Specimen Under-filled or Over-Filled</td>
<td>Specimen volume incorrect for test performance. Verify that collection device volume is sufficient for desired test and that collection device is filled to appropriate fill line.</td>
</tr>
</tbody>
</table>
1. If it is necessary to re-centrifuge a tube, **DO NOT DELAY**. The clot is continuing to retract and will expel more serum that has been in contact with the cells for too long if there is a delay in re-centrifuging.

2. Do not place labels over expiration dates or remove expiration dates of collection tubes. If the expiration date of a collection tube cannot be verified, the tube will be assumed to be expired and the specimen will be rejected.

---

**BLOOD COLLECTION TUBES for MPHL TESTING**

<table>

<td>Shake tubes 10 times firmly enough to ensure the entire surface of the tube is coated with blood cells to solubilize the antigen on the tube walls. Tube must be moved to a 37°C ±1°C incubator within 16 hours of collection. Do not centrifuge or refrigerate specimens.</td>
</tr>
</tbody>
</table>
### Ameobic Trophozoites

**Form 402**

**Approved Submitters:** All

**Sample Type:** Stool collected in PVA preservative and/or Trichrome stained slide. Please contact the lab for appropriate collection bottle.

**Volume/Amount Required:** Add stool until PVA rises to fill line.

**Collection Guidelines:** Completely emulsify the stool using spork attached to lid. **Do not overfill the bottle. Fill to the fill line.**

**Storage Instructions:** Ambient temperature

**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.

**Test Method:** Trichrome stain

**Test Availability:** Monday-Friday

**Limitations:** The ability to detect parasites is limited by the quality of the specimen collection. A single negative specimen does not rule out parasitic infection.

**Reference Value:** Normally Negative

**Turnaround time:** 1-5 business days

**Critical organism identification will be phoned to Health Care Providers immediately.**

### Anemia Screen: see Hemoglobin and Hematocrit

### Arbovirus IgM antibody Screening for West Nile, LaCrosse, St. Louis Encephalitis Virus, and Eastern Equine Encephalitis Viruses.

**Form 8021**

West Nile Virus antibody screening is performed on all submissions. LaCrosse antibody screening is automatically performed for patients under 25 years old. St. Louis Encephalitis Virus (SLE), and Eastern Equine Encephalitis (EEE) IgM antibody screening is performed as recommended by Office of Epidemiology.

**Approved Submitters:** All

**Sample Requirements:** 2mL Serum or 2mL CSF

**Collection Guidelines:** Serum samples should be collected at least 7 days post onset of symptoms. Samples testing negative and collected sooner should be recollected.

**Storage instructions:** Do not freeze. CSF samples may be stored at 2-8 degrees C (in the refrigerator) for indefinite periods in tightly capped glass or polypropylene tubes. Do not store in polystyrene. Some CSF collection kits have polystyrene containers. If CSF is collected into polystyrene, aliquot into glass or polypropylene for storage and shipping. Once serum has been separated from red cells, it may be stored at 2-8 degrees C for indefinite periods. Do not store in polystyrene. Serum should be collected in tubes with gel separator. Free hemoglobin causes false positive test results. All samples with visible hemolysis will be rejected. DO NOT FREEZE.

**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.
Additional Test Information:
- Testing may be performed on serum or CSF or both. However, serum is the specimen of choice. Antibody levels in CSF tend to be lower.
- Request must include travel history, date of onset and date of collection. Travel history is mandatory for determining which antigens to test. All samples must be accompanied by a completed MSDH Form # 8021.

Test Method: Enzyme Immunoassay (EIA)
Test Availability: Monday-Friday
Limitations: Cross-reactivity between St. Louis Encephalitis Virus and West Nile Virus is common. Generally, primary responders exhibit mainly monotypic antibody responses; however, during successive infections, the antibody response broadens to include heterotypic reactivity to other flaviviruses in the same or different antigenic groups. Results from immunosuppressed patients must be interpreted with caution.

Test Specific Causes for Rejection: West Nile: Specimen grossly hemolyzed or lipemic; St. Louis Encephalitis (SLE); LaCrosse (LAC), and Eastern Equine Encephalitis (EEE): Specimen grossly hemolyzed.

Reference Value: Normally Non-Reactive
Turnaround time: 10 business days. Testing may be delayed in winter months when demand is lower.

Arbovirus (Zika, Dengue, Chickungunya) IgM Antibody Testing

Approved Submitters: Office of Epidemiology approval required prior to submittal.
Sample Type: Serum and CSF. CSF MUST be submitted with a patient-matched serum specimen
Volume/Amount Required: 2mL serum; 2mL CSF
Collection Guidelines: Collect whole blood in serum separator tube (SST) or plain red top tube. SST is the preferred specimen collection device. Collect CSF in a sterile container.
Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Specimens must be received within 24 hours of collection.
Test Method: Enzyme Immunoassay (EIA)
Test Availability: Monday-Friday
Limitations: IgM antibodies against Zika virus, dengue viruses, and other flaviviruses (e.g., yellow fever virus, West Nile virus) can cross-react possibly generating false positive results in serological tests; therefore, all IgM positive samples will be referred to the CDC for plaque-reduction neutralization testing to discriminate among these viruses.

Results of this test cannot be used as the sole basis of patient management decisions and must be combined with clinical observations, patient history, epidemiological information, and other laboratory evidence. Zika IgM levels over the course of illness are not well characterized. IgM levels are variable, but generally are positive starting near day four post onset of symptoms and continuing for 12 or more weeks following initial infection.
Negative results do not preclude the possibility of Zika virus infection, past or present. Negative results may be seen in specimens collected before day four post onset of symptoms or after the window of detectable IgM closes.

Test Specific Causes for Rejection: Specimen received at room temperature. A CSF specimen received without a complimentary serum specimen.

Reference Value: Normally Non-Reactive
Turnaround time: 5 to 10 business days
Arbovirus (Zika Dengue, and Chickungunya Virus) RNA by RT-PCR

Zika Virus Test Requisition Form
Approved Submitters: Office of Epidemiology approval required prior to submittal
Sample Type: Serum, whole blood and urine MUST be submitted on all patients. CSF and amniotic fluid may also be submitted in conjunction with serum, whole blood, and urine specimens.
Collection Guidelines:
- Collect a minimum of 2mL of serum, 2mL whole blood and 1mL of urine from symptomatic patients < 14 days post onset of symptoms or from asymptomatic pregnant women < 14 days after return from travel or exposure.
- 2mL of CSF or amniotic fluid may also be submitted in conjunction with above three specimen types for symptomatic patients.
Required Specimens:
Urine: Always obtain a urine first. Collect urine in a sterile container. Urine specimen cups leak and are not recommended for shipping. To avoid leakage of the urine sample, transfer the urine to a small sterile screw-cap tube (e.g., 15mL conical tube) and use parafilm to seal.
Serum: Collect serum in a red top or marble-top (serum separator) Vacutainer type tube. If using a SST, promptly separate (centrifuge) serum from cells. Store the SST tube refrigerated. If using a red top, centrifuge and transfer the serum to a screw cap sterile tube. Store the serum refrigerated. Submit 2-5 mL of serum transported with a cold pack.
Whole Blood: Collect whole blood in an EDTA tube.
Optional Specimens:
CSF: If CSF is obtained, collect > 1mL of CSF in a tube with NO anticoagulant or preservative. Transport with a cold pack. A serum, urine and whole blood specimen must be submitted along with the CSF.
Amniotic fluid: Collect fluid in a sterile container. Urine specimen cups leak and are not recommended for shipping. To avoid leakage of the urine sample, transfer the urine to a small sterile screw-cap tube (e.g., 15mL conical tube) and use parafilm to seal.
Storage Requirements: Store samples refrigerated until transport. Ship specimens on cold packs.
Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Label the package to the attention of Molecular Diagnostics.
Additional Test Information: Real-Time PCR testing for Zika Virus, Chikungunya Virus, and Dengue Virus by the CDC Triplex rRT-PCR Assay, verified for use under Emergency Use Authorization by the FDA.
Test Method: Reverse Transcription Polymerase Chain Reaction (RT-PCR)
Test Availability: Monday-Friday. With notification Saturday and Sunday testing is available.
Limitations: Reliable results are dependent on appropriate specimen collection and transport procedures.
Reference Value: Normally Not Detected
Turnaround time: 2 business days

ALT: see Chemistry Panel

Bacillus anthracis
Form 402
Approved Submitters: MS Sentinel Laboratories, Law Enforcement, MSDH Office of Emergency Preparedness and Response
Sample Type:
• **Clinical Specimens** - aseptically collected lesions or eschar aspirates, whole blood in EDTA, serum, plasma, tissue, tissue biopsies in screw-capped tube (with or without swab used to collect sample), stool or rectal swab(s), sputum, pleural fluid, and transtracheal aspirates or washes.

• **Culture** - pure growing culture isolate on an appropriate agar slant in a screw capped tube; blood culture isolate.

• **Environmental samples** as submitted by law enforcement personnel.

**Volume/Amount Required:** Stool should be equal to or greater than 5 grams (pecan size). Sputum volume must equal at least 1mL. Whole blood, plasma, serum, pleural fluid, and aspirates/washes volume must equal at least 0.5mL.

**Collection Guidelines:**

- For vesicular fluid or eschar material
  - Unroof vesicle and aspirate fluid or collect with two sterile swabs (dacron).
  - Insert swab (dacron) beneath the edge of the eschar, rotate swab or obtain an aspirate. Transport specimens at room temperature.

- For tissue
  - Tissue pieces should be collected and kept moist.
  - Transport in sterile container at room temperature within 1 hour of collection.

- Whole blood (PCR only)
  - Allow any size EDTA (lavender top) tube to completely fill.

**Shipping Requirements:** Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E. Ship all isolates at room temperature using current shipping guidelines for biological substances, Appendix E.

**Additional Test Information:** Notify MPHL Bioterrorism Coordinator or MPHL Special Microbiology Section at 601-576-7400 prior to submission.

**Test Method:** Conventional culture and Polymerase Chain Reaction (PCR)

**Test Availability:** Tested Monday-Friday. With notification, Saturday, and Sunday testing available.

**Limitations:**

- **PCR:** If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported, or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.

- **Conventional Culture and Biochemicals:** Organism must be viable for testing.

**Reference Value:** Normally Not Detected

**Turnaround time:** A preliminary report is available within 24 hours. A final report is available within 10 days.

**Critical Test Value:** All test results are reported to submitter.

See Appendix E for more shipping information

---

**Bilirubin, total:** see Chemistry Panel

---

**Bordetella species** (*B. pertussis, parapertussis, and holmesii*) PCR

**Form 402**

**Approved Submitters:** All

**Sample Type:** A dry nasopharyngeal swab with a synthetic tip and a metal or plastic shaft in a sterile 15mL conical tube/urine cup without transport media or 0.5 mL of a nasal wash.
**Collection Guidelines:**
- Swabs with calcium alginate or cotton tips and wooden shafts are **NOT** acceptable.
- For best results, collect specimens prior to beginning antibiotic regimen.
- **See Appendix J for complete instructions.**

**Storage Requirements:** Specimen should be immediately refrigerated at 2°-8°C

**Shipping Requirements:** Shipped on ice packs within 24 hours following current shipping guidelines for biological substances, Appendix E.

**Additional Test Information:** PCR has optimal sensitivity during the first 3 weeks of cough when bacterial DNA is still present in the nasopharynx. After the fourth week of cough, the amount of bacterial DNA rapidly diminishes which increases the risk of obtaining false-negative results.

**Test Method:** Polymerase Chain Reaction (PCR)

**Test Availability:** Monday-Friday

**Limitations:** PCR testing following antibiotic therapy can result in false-negative findings. The exact duration of positivity following antibiotic use is not well understood, but PCR testing after 5 days of antibiotic use is unlikely to be of benefit and is generally not recommended.

**Test Specific Causes for Rejection:** Improper shipping conditions; swab with calcium alginate or cotton tips and wooden shafts used for collection.

**Reference Value:** Normally Not Detected

**Turnaround time:** 3 business days

**Critical Test Value:** All positives phoned to Health Care Providers immediately.

**See Appendix I for complete collection instructions**

---

**Brucella species**

**Form 402**

**Approved Submitters:** MS Sentinel Laboratories, Law Enforcement, MSDH Office of Emergency Preparedness and Response.

**Sample Type:**
- **Clinical Specimens:** EDTA whole blood, serum, tissue (spleen, liver), joint fluid, abscesses, exudates.
- **Culture:** pure growing culture isolate on an appropriate agar slant in a screw capped tube, bone marrow culture, blood culture.
- **Environmental samples** submitted by law enforcement personnel.

**Volume/Amount Required:** 1 mL fluid, 0.5 mL blood, and 0.1 gram tissue.

**Collection Guidelines:** For whole blood, allow any size EDTA (lavender top) tube to completely fill, half full minimum. Tissue pieces (at least the size of a pea) should be collected and kept moist for transport in sterile container at room temperature.

**Storage Instructions:** Clinical specimens should be stored at 2-8°C. Isolates and environmental samples should be stored at room temperature.

**Shipping Requirements:** Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E. Ship all isolates at room temperature using current shipping guidelines for biological substances, Appendix E.

**Additional Test Information:** Notify MPHL Bioterrorism Coordinator or MPHL Special Microbiology Section at 601-576-7400 prior to submission.

**Test Method:** Conventional Culture and Polymerase Chain Reaction (PCR)

**Test Availability:** Tested Monday-Friday. With notification, Saturday, and Sunday testing available.

**Limitations:**
- **PCR:** If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported, or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.
Conventional Culture and Biochemicals: Organism must be viable for testing.

Reference Value: Normally Not Detected

Turnaround time: A preliminary report is available within 24 hours. A final report is available within 10 days.

Critical Test Value: All test results are reported to submitter.

See Appendix E for more shipping information

**Burkholderia mallei/pseudomallei species**

Form 402

Sample Type:

- Clinical Specimens: EDTA whole blood, serum, sputum, bronchial aspirates, abscess material, wound swabs, urine.
- Culture: pure growing culture isolate on an appropriate agar slant in a screw capped tube, bone marrow culture, blood culture.
- Environmental samples submitted by law enforcement personnel.

Volume/Amount Required: 1 mL fluids, 0.5 mL blood, and 0.1 gram tissue.

Collection Guidelines: For whole blood, allow any size EDTA (lavender top) tube to completely fill, half full minimum. Tissue pieces (at least the size of a pea) should be collected and kept moist for transport in sterile container at room temperature.

Storage Instructions: Clinical specimens should be stored at 2-8°C. Isolates and environmental samples should be stored at room temperature.

Shipping Requirements: Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E. Ship all isolates at room temperature using current shipping guidelines for biological substances, Appendix E.

Additional Test Information: Notify MPHL Bioterrorism Coordinator or MPHL Special Microbiology Section at 601-576-7400 prior to submission.

Test Method: Conventional Culture and Polymerase Chain Reaction (PCR).

Test Availability: Tested Monday-Friday. With notification, Saturday, and Sunday

Limitations:

- PCR: If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported, or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.
- Conventional Culture and Biochemicals: Organism must be viable for testing.

Reference Value: Normally Not Detected

Turnaround time: A preliminary report is available within 24 hours. A final report is available within 10 days.

Critical Test Value: All test results are reported to submitter.

See Appendix E for more shipping information

BUN: see Chemistry Panel
**Chemical Terrorism Agents**

Form 402

Approved Submitters: Approval must be received from the Office of Epidemiology at 601-576-7400.

For Sample Type, Collection Guidelines, Storage Requirements and Documentation Requirements visit [https://www.msdh.ms.gov/msdhsite/_static/14,0,188,617.html](https://www.msdh.ms.gov/msdhsite/_static/14,0,188,617.html)

The PHL has the capacity to analyze certain clinical samples for specific chemical terrorism agents. These include:

- Trace metals in blood and urine by ICP-MS
- Cyanide in blood by GC-MS
- Volatile Organic Compounds (VOC) in blood by GC-MS
- Tetramine in urine by GC-MS
- Organophosphate Nerve Agent (OPNA) metabolites in urine by LC/MS/MS
- Abrine/ricinine in urine by LC/MS/MS
- HNPAA (Tetranitromethanes) in urine by LC/MS/MS
- Metabolic Toxins Panel (MTP) by LC/MS/MS

**Additional Test Information**

Prepare, maintain, and send chain of custody forms. Prior to submitting chemical samples for laboratory testing, contact the Chemical Terrorism Coordinator, or the Biochemistry Section Director at 601-576-7400.

**Test Specific Causes for Rejection:**

- **Tetramine, HNPAA, OPNA, and Abrine/ricine:** Specimen not stored at -20°C; urine specimen contains visible blood or contamination.
- **Cyanide:** Failure to maintain specimen at refrigerated temperatures (4-8°C); Specimen frozen; Specimen clotted.

**Test Availability:** Tested Monday-Friday. With notification Saturday and Sunday testing is available.

See Appendix E for more shipping information

---

**Chemistry Panel**

Form 405

**Tests available:** Sodium, Potassium, Chloride, BUN, Creatinine, Uric Acid, AST (SGOT), ALT (SGPT), Total Bilirubin, Total Cholesterol, HDL Cholesterol, Triglycerides, calculated LDL Cholesterol and Glucose, or

**Form 406 for Glucose Only.**

Approved Submitters: MSDH facilities

**Sample Type:** Serum

**Volume/Amount Required:** 3 mL minimum

**Collection Guidelines:** Collect serum in a gold topped SST (gel-separator) tube. Immediately invert gently 5 times. Keep tube in vertical position until centrifugation step. Centrifuge at 3000 RPMs for 15 minutes between 30 minutes and 2 hours after collection.

**Storage Instructions:** Specimens must be received within 5 days of collection. Submit samples as soon as possible after collection. Refrigerate specimens until shipment.
Shipping Requirements: Ship specimen with a cold pack in a rigid leak-proof container (cooler or Styrofoam box only).

**Test Methods:** Automated chemistry analyzer.

**Test Availability:** Monday-Friday

**Test Specific Causes for Rejection:** Na, K, Cl – Blood collection tube not centrifuged; blood collection tube centrifuged incorrectly resulting in too many red cells remaining above the gel plug; hemolysis (invalidates the potassium result); specimen not received within 1 week; Bun, Creatinine, Uric Acid, Total Bilirubin, Total Cholesterol, HDL Cholesterol, Triglycerides, ALT: Blood collection tube not centrifuged; blood collection tube centrifuged incorrectly resulting in too many red cells remaining above the gel plug; specimen not received within 96 hours; hemolysis.

**Form 984**

**Approved Submitters:** MSDH facilities

**Sample Type:** Vaginal swabs, male penile swabs, female and male urine specimens, male and female throat and rectal swabs. NOTE: Different MPHL-provided collection and transport kits are required for each collection site.

**Volume/Amount Required:** Transfer urine into the Gen-Probe Urine Specimen Transport Tube until volume is between black fill lines on device. Place swab into Gen-Probe Swab Transport tube and break swab shaft at the score line.

**Collection Guidelines:** See Appendix G for detailed instructions.

**Storage Instructions:** Samples in transport tubes may be kept at room temperature for up to 30 days. Samples must be shipped at room temperature.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

**Test Method:** NAAT (Aptima Combo 2 for CT/NG).

**Test Availability:** Monday-Friday

**Limitations:** Results from the NAAT are not intended for the evaluation of medico-legal cases. Reliable results are dependent on adequate specimen collection. Therapeutic failure or success cannot be determined with the NAAT because nucleic acids may persist following appropriate antimicrobial therapy.

**Test Specific Causes for Rejection:** Specimen transported refrigerated or frozen; inappropriate specimen collection kit used for identified site/source; no swab in tube or 2 swabs submitted in the same specimen transport tube; cleaning swab submitted in specimen transport tube; insufficient amount of urine in specimen collection tube (should not be above or below fill lines); specimen collected for medico-legal purposes; specimen collected from patient less than 10 years of age.

**Reference Value:** Normally Negative

**Turnaround time:** 5 business days

See Appendix G for complete collection instructions

**Chloride:** see Chemistry Panel
### Cholera and Non-Cholera *Vibrio*

**Form 402**  
**Approved Submitters:** All  
**Sample Type:** Stool in Cary-Blair transport media, bacterial isolates.  
**Volume/Amount Required:** Fill transport bottle to fill line for stool  
Do not overfill the bottle.  
**Collection Guidelines:** Completely emulsify the stool using spork attached to lid.  
**Storage Instructions:** Ambient temperature.  
**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.  
**Test Method:** Conventional culture and biochemicals.  
**Test Availability:** Monday-Friday  
**Limitations:** Culture must be viable.  
**Reference Value:** Normally Negative  
**Turnaround time:** Bacterial isolation, typing and identification can take up to 21 days.  
**Critical Test Value:** All results are phoned to Health Care Providers immediately.

---

### Cholesterol, total, LDL and HDL: see Chemistry Panel

---

### Complete Blood Count (CBC)

**Form 403**  
**Approved Submitters:** MSDH facilities  
**Sample Type:** EDTA whole blood  
**Volume/Amount Required:** Allow any size lavender top tube to completely fill, minimum half full. 2 mL whole blood required for analysis.  
**Collection Guidelines:** Immediately invert gently 8-10 times after collection.  
Do not collect specimens on Friday for Saturday delivery.  
**Storage Instructions:** Specimens must be received by the laboratory within 24 hours of collection. Refrigerate if possible until shipment.  
**Shipping Requirements:** Specimens must be shipped on cold packs. Specimens should not be placed in direct contact with the cold packs as this may affect specimen integrity. Blood tube should be wrapped or separated from the cold packs with multiple layers of paper towels, absorbent paper or padded envelopes. Follow current shipping instructions for MSDH Contract Courier using cold packs in a rigid outer container (Styrofoam box or cooler); Do not ship specimens in an envelope to avoid damage and leakage issues during transit.  
**Additional Test Information:** CBC without WBC differential includes total WBC and Platelet count. If a CBC with WBC differential is ordered, an automated differential is performed initially. Additional manual assessments of stained smears are performed if results meet specific instrument flagging criteria. Smear review includes assessment of WBC cell populations, presence of WBC and/or RBC inclusions, RBC morphology, and platelet evaluation.  
**Test Method:** Electronic impedance  
**Test Availability:** Tuesday-Friday.  Do not collect on Friday for Saturday delivery.  
**Limitations:** CBC parameters may be affected by the length of time between specimen collection and test performance.  
**Test Specific Causes for Rejection:** Specimen hemolyzed; Specimen not received within 24 hrs. of collection; specimen clotted; specimen received at room temperature.

**Turnaround time:** 3 business days

**Critical Test Value:** The following test results are phoned to Health Care Providers immediately:
Hemoglobin less than 6.0 and greater than 20.0 mg/dL; Platelet count less than 50,000/dL.
WBC less than 2,000/μL and greater than 25,000/μL; nucleated RBC, sickle cells, immature or abnormal cells on differential count.

**Core Antibody:** see Hepatitis B Core Antibody
**Coxiella burnetii**

Form 402  
**Approved Submitters:** MS Sentinel Laboratories, Law Enforcement, MSDH Office of Emergency Preparedness and Response.  

**Sample Type:**  
- **Clinical Specimens:** EDTA whole blood, serum.  
- **Environmental samples** submitted by law enforcement personnel.  

**Volume/Amount Required:** 0.5 mL blood  

**Collection Guidelines:** Collect blood in EDTA (lavender) or sodium citrate (blue) and maintain at 4°C for storage and shipping.  

**Storage Instructions:** Clinical specimens should be stored at 2-8°C.  

**Shipping Requirements:** Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E.  

*Label the package to the attention of Molecular Diagnostics.*  

**Test Method:** Polymerase Chain Reaction (PCR)  

**Additional Test Information:** Notify MPHL Bioterrorism Coordinator or MPHL Special Microbiology Section at 601-576-7400 prior to submission. Due to the extreme infectivity of *C. burnetii*, Level A (Sentinel) laboratories should not attempt to culture this organism.  

**Test Availability:** Tested Monday-Friday. With notification, Saturday, and Sunday testing available.  

**Limitations:** PCR: If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported, or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.  

**Reference Value:** Normally Not Detected  

**Turnaround time:** 24 hours. A preliminary report is available within 24 hours. A final report is available within 10 days.  

**Critical Test Value:** All test results are reported to submitter.  

See Appendix E for more shipping information

---

**Creatinine:** see Chemistry Panel

---

**Cryptosporidium, Cyclospora, Microsporidium, and Isospora**

Form 402  
**Approved Submitters:** Performed only on special request. Please contact the lab before sending.  

**Sample Type:** Stool in 10% formalin  

**Volume/Amount Required:** Add stool exactly to fill line. **Do not overfill the bottle.**  

**Collection Guidelines:** Submit in formalin transport bottle obtained from the laboratory; completely emulsify the stool using spork attached to lid.  

**Storage Instructions:** Ambient temperature  

**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.  

**Additional Test Information:** Please contact the lab for collection bottle and instructions.  

**Test Methods:** Biochemical staining and microscopy.  

**Test Availability:** Monday-Friday  

**Limitations:** The ability to detect parasites is limited by the quality of the specimen collection. A single negative specimen does not rule out parasitic infection.  

**Test Specific Causes for Rejection:** Specimen bottle over or under filled; Stool not emulsified.
**Reference Value:** Normally Negative  
**Turnaround time:** 5 days, longer if referred to CDC  
**Critical Test Value:** All positives phoned to Health Care Providers immediately.

### Cultures (eye, ear, superficial wound, other sites)
**Form 402**  
**Approved Submitters:** MSDH facilities  
**Sample Type:** Swab from body site collected using Culturette™ or equivalent.  
**Collection Guidelines:** Take care to crush or break ampule to release transport media immediately following collection.  
**Storage Instructions:** Follow instructions for collection device. Culturette must be received within 48 hours of collection.  
**Shipping Requirements:** Silica Gel Strep Mailers are unacceptable. Current shipping instructions for MSDH Contract Courier.  
**Test Methods:** Conventional culture and biochemicals.  
**Test Availability:** Monday-Friday  
**Limitations:** Organism must be viable.  
**Test Specific Causes for Rejection:** Culturette with ampule crushed must be received within 48 hours of collection.  
**Reference Value:** Normally Negative  
**Turnaround time:** 3-14 business days

### Dengue Virus: see Arbovirus IgM Antibody Testing and Arbovirus RNA Virus detection by RT-PCR

### Diphtheria Culture
**Form 402**  
**Approved Submitters:** All  
**Sample Type:** Swab obtained from nose, throat, or skin lesion in transport media.  
**Collection Guidelines:** The swab should be submitted in Stuart’s or Amie’s Transport Media available in the form of a culturette from Central Supply. NOTE: This is the same culturette used other miscellaneous cultures. Swabs in silica gel packs will be accepted.  
**Storage Instructions:** Specimens should be received within 24 hours of collection. Store at ambient temperature until shipment.  
**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.  
**Test Methods:** Conventional culture and biochemicals.  
**Additional Test Information:** Notify lab when a specimen is being collected.  
**Test Availability:** Monday-Friday  
**Limitations:** Organism must be viable.  
**Reference Value:** Normally Negative  
**Turnaround time:** Bacterial isolation and identification can take up to 14 days.  
**Critical Test Value:** All results are phoned to Health Care Providers immediately.
### Eastern Equine Encephalitis Virus Antibodies: see Arbovirus Screening

#### Enteric culture-Salmonella/Shigella/Campylobacter/E. Coli O157

**Form 402**  
**Approved Submitters:** All  
**Sample Type:** Stool in Cary-Blair transport media, bacterial isolates.  
**Volume/Amount Required:** Fill transport bottle to fill line for stool. **Do not overfill the bottle.**  
**Collection Guidelines:** Completely emulsify the stool using spork attached to lid.  
**Storage Instructions:** Refrigerate; stool must be received within 96 hours of collection (Ship on cold packs).  
**Shipping Requirements:** Current shipping guidelines for Biological Substances, Appendix E.  
**Test Methods:** Conventional culture and biochemicals.  
**Test Availability:** Monday –Friday  
**Limitations:** Organism must be viable.  
**Test Specific Causes for Rejection:** Specimen preserved in Cary Blair vial must be received within 96 hours of collection; culturette with ampule crushed must be received within 3 days of collection; specimen in specimen container without preservative should be received on a cold pack within 24 hours (raw stool specimen received on cold pack after 24 hours of collection will be acceptable for Shiga toxin producing E. coli testing only); specimen container under-filled or overfilled.  
**Reference Value:** Normally Negative  
**Turnaround time:** Bacterial isolation and identification can take up to 14 days; Salmonella typing can take up to 31 days.

### Flu: see Influenza

#### Francisella tularensis

**Form 402**  
**Approved Submitters:** MS Sentinel Laboratories, Law Enforcement, MSDH Office of Emergency Preparedness and Response.  
**Sample Type:**  
- **Clinical Specimens:** tissue, scraping of ulcer, swab(s) of ulcer, lymph node aspirate, tissue aspirates, pleural fluid, EDTA whole blood, and respiratory samples.  
- **Culture:** pure growing culture isolate on an appropriate agar slant in a screw capped tube or blood culture.  
- **Environmental samples** submitted by law enforcement personnel.  
**Volume/Amount Required:** 1 mL sputum, 0.5 mL blood, 0.5 mL fluids and 1 gram tissue.  
**Collection Guidelines:** For whole blood, allow any size EDTA (lavender top) tube to completely fill, half full minimum. Tissue pieces (at least the size of a pea) should be collected and kept moist for transport in sterile container at room temperature.  
**Storage Instructions:** Clinical specimens should be stored at 2-8°C. Isolates and environmental samples should be stored at room temperature.
**Shipping Requirements**: Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E. Ship all isolates at room temperature using current shipping guidelines for biological substances, Appendix E.

**Additional Test Information**: Notify MPHL Bioterrorism Coordinator or Special Microbiology Section at 601-576-7400 prior to submission.

**Test Method**: Conventional culture and Polymerase Chain Reaction (PCR).

**Test Availability**: Tested Monday-Friday. With notification, Saturday, and Sunday.

**Limitations**:
- **PCR**: If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported, or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.
- **Conventional Culture and Biochemicals**: Organism must be viable for testing.

**Reference Value**: Normally Not Detected

**Turnaround time**: A preliminary report is available within 24 hours. A final report is available within 10 days.

**Critical Test Value**: All test results are phoned to submitter.

See Appendix E for more shipping information

---

**Gonorrhea NAAT**: see Chlamydia/Gonorrhea NAAT

**Glucose**

**Form 406**

**Approved Submitters**: MSDH facilities

**Sample Type**: EDTA fluoride whole blood (gray top tube).

**Volume/Amount Required**: Tube designed to draw half full.

**Collection Guidelines**: Invert gently 10 times immediately after collection.

**Storage Instructions**: Specimen must be received in laboratory within 72 hours of collection, store at room temperature until shipment.

**Shipping Requirements**: Current shipping instructions for MSDH Contract Courier.

**Additional Test Information**:
- If glucose is ordered as one of several chemistry tests, Form 406 must be completed and submitted with a gray top tube as a separate test.

**Test Methods**: Photometric, adaption of hexokinase G6PD.

**Test Availability**: Monday-Friday

**Test Specific Causes for Rejection**: Specimen too old (must be received within 72 hours); specimen has excessive hemolysis, lipemia, or icterus.

**Reference Ranges**:

<table>
<thead>
<tr>
<th>Test Type</th>

<tbody>
<tr>
<td>Fasting glucose</td>
<td>74-106 mg/dL</td>
</tr>
<tr>
<td>Random or casual glucose (CPG)</td>
<td>Less than140 mg/dL</td>
</tr>
</tbody>
</table>

**Turnaround time**: 3 business days

**Critical Test Value**: Results of less than 40 or greater than 250 mg/dL are phoned to Health Care Providers immediately.
hCG, quantitative, serum (Pregnancy Testing)

Form 402
Approved Submitters: MSDH Facilities
Sample Type: Serum, whole blood in plain (red top) or SST tube.
Volume/Amount Required: 1 mL serum
Collection Guidelines: Avoid hemolysis.
Storage Instructions: Specimen must be received in laboratory within 5 days of collection. Refrigerate the specimen if possible until shipment.
Shipping Requirements: Current shipping instructions for MSDH Contract Courier.
Test Method: Chemiluminescence Immunoassay.
Test Availability: Monday-Friday
Limitations: Heterophilic antibodies in serum or plasma samples may cause interference in immunoassays. These antibodies may be present in blood samples from individuals regularly exposed to animals or who have been treated with animal serum products. Exogenous hCG administered within 7–10 days of sampling may give a detectable test result. When using the determination of hCG to confirm pregnancy, care should be taken to exclude the possibility of hCG secreting tumors.
Test Specific Causes for Rejection: Specimen not received in laboratory within 5 days of collection.
Reference Value: 0-3mIU/L in healthy males and non-pregnant females.
Values greater than or equal to 25mIU/L indicate possible pregnancy in females.
Turnaround Time: 3 business days
Critical Test Value: Any decrease in hCG levels from previously reported results phoned to Health Care Providers immediately.

Hemoglobin Confirmation for Newborn Screening

Form 490
Approved Submitters: MSDH facilities
Sample Type: EDTA (lavender top) whole blood collected in microtainer type tube.
Volume/Amount Required: Filled microtainer type tube.
Collection Guidelines: Following collection, immediately invert gently 5 times.
Storage Instructions: Specimen must be received in laboratory within 96 hours of collection, refrigerate if possible until shipment.
Shipping Requirements: Current shipping instructions for MSDH Contract Courier.
Additional Test Information:
- Collect specimens following instructions from Genetic Screening Program.
- Attach Genetic Screening label as well as Epic label.
- Provide Newborn Screening identification number and any former names.
Test Method: Electrophoresis
Test Availability: Monday-Friday
Limitations: Some abnormal hemoglobins have similar electrophoretic mobilities and may not be differentiated by this methodology.
Reference Ranges:

### Hemoglobin Electrophoresis (Sickle Cell Screening)

**Form 490**

**Approved Submitters:** MSDH facilities

**Sample Type:** EDTA (lavender top) whole blood.

**Volume/Amount Required:** Filled microtainer type tube or 2 mL whole blood in EDTA (lavender top) tube.

**Collection Guidelines:** Following collection, immediately invert gently 5 times.

**Storage Instructions:** Specimen must be received in laboratory within 96 hours of collection.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier; refrigerate if possible until shipment.

**Collection Guidelines:** Following collection, immediately invert gently 5 times.

**Storage Instructions:** Specimen must be received in laboratory within 96 hours of collection.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier; refrigerate if possible until shipment.

**Additional Test Information:** Test is intended for adults and children OVER six months old. This test is NOT performed for newborn screening.

**Test Method:** Electrophoresis

**Test Availability:** Monday-Friday

**Limitations:** Some abnormal hemoglobins have similar electrophoretic mobilities and may not be differentiated by this methodology.

**Test Specific Causes for Rejection:** Specimen not received within 96 hours of collection.

**Turnaround time:** 3 business days.

**Critical Test Value:** hemoglobin levels less than 6.0 or greater than 20.0 g/dL phoned to Health Care Providers immediately.

---

### Hepatitis A Antibody, Total and IgM class

**Form 402**

**Approved Submitters:** MSDH facilities

**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube.

**Volume/Amount Required:** 4 mL whole blood or 2 mL serum.

**Collection Guidelines:** Collect whole blood in serum separator tube (SST) or plain red top tube. An SST tube can be accepted spun or unspun.

**Storage Instructions:** Store refrigerated if possible until shipment. However, room temperature storage is acceptable.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.

**Additional Test Information:** Samples are initially tested for Hepatitis A total antibodies with reflex testing for IgM class antibodies if indicated.

**Test Methods:** Chemiluminescence Immunoassay

**Test Availability:** Monday-Friday

**Limitations:** Levels of Hep A antibody may be below detectable limits in early infection. Individuals who received the vaccine may demonstrate a detectable level of antibody. Heterophilic antibodies in serum samples may cause interference in immunoassays.

**Test Specific Causes for Rejection:** Specimens with less than 2 mL whole blood; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.

**Reference Ranges:** Normally Non-Reactive

**Turnaround time:** 5 business days

**Critical Test Value:** Reactive Hepatitis A IgM Antibody results phoned to Health Care Providers immediately.

---

### Hepatitis B Core Total Antibody with reflex to Hepatitis B Core IgM Antibody

**Form 499**

**Approved Submitters:** MSDH facilities

**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube

**Volume/Amount Required:** 4 mL whole blood or 2 mL serum.
Collection Guidelines: Collect whole blood in serum separator tube (SST) or plain red top tube. A SST tube can be accepted spun or unspun.

Storage Instructions: Store refrigerated if possible until shipment. However, room temperature is acceptable.

Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.

Additional Test Information:
- If Hepatitis B Core total antibodies are positive, then a test for hepatitis B core IgM class antibodies is performed.

Test Method: Chemiluminescence Immunoassay

Test Availability: Monday-Friday

Limitations: Levels of HBC Ab may be undetectable in early infections. Heterophilic antibodies in serum samples may cause interference in immunoassays. Results from immunosuppressed individuals should be interpreted with caution.

Test Specific Causes for Rejection: Specimens with less than 2 mL whole blood; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.

Reference Value: Normally Non-Reactive; Interpretation depends on clinical setting.

Turnaround time: 5 business days.

---

Hepatitis B Surface Antigen

Form 499

Approved Submitters: MSDH facilities

Sample Type: Serum, whole blood collected in plain (red top) or SST tube.

Volume/Amount Required: 4 mL whole blood or 2 mL serum.

Collection Guidelines: Collect whole blood in serum separator tube (SST) or plain red top tube. A SST tube can be accepted spun or unspun.

Storage Instructions: Store refrigerated if possible until shipment, room temperature is acceptable.

Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.

Additional Test Information: A hepatitis profile consisting of Hepatitis B Core Antibody and Hepatitis B Core IgM Antibody is run on all first-time positive patients. Reflex testing for confirmation using antibody neutralization methods performed if indicated.

Test Method: Chemiluminescence Immunoassay

Test Availability: Monday-Friday

Limitations: A negative result does not exclude the possibility of exposure to or infection with Hepatitis B virus. Recently vaccinated individuals may exhibit a transient positive result.

Test Specific Causes for Rejection: Specimens with less than 2 mL whole blood; specimens from patients less than 3 years of age; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.

Reference Value: Normally Non-Reactive

Turnaround time: 5 business days

Critical Test Value: All results in blood exposure incidents phoned to Health Care Providers immediately.
**Hepatitis B Surface Antibody**

**Form 499**

**Approved Submitters:** MSDH facilities  
**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube.  
**Volume/Amount Required:** 4 mL whole blood or 2 mL serum.  
**Collection Guidelines:** Collect whole blood in serum separator tube (SST) or plain red top tube. A SST tube can be accepted spun or unspun.  
**Storage Instructions:** Store refrigerated if possible until shipment, room temperature is acceptable.  
**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.  
**Test Method:** Chemiluminescence Immunoassay.  
**Test Availability:** Monday-Friday  
**Interpretative Guidance:** Refer to the CDC’s Hepatitis B serologic testing interpretative guide at [http://www.cdc.gov/hepatitis/HBV/PDFs/SerologicChartv8.pdf](http://www.cdc.gov/hepatitis/HBV/PDFs/SerologicChartv8.pdf) for assistance.  
**Limitations:** This assay does not differentiate between a vaccine induced immune response and an immune response induced by infection with HBV. Results from immunosuppressed individuals should be interpreted with caution. Individuals that have received blood component therapy during the previous 3-6 months may have a false reactive result due to passive transfer of antibody.  
**Test Specific Causes for Rejection:** Specimens with less than 2 mL whole blood; specimens from patients less than 3 years of age; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.  
**Reference Value:** Unvaccinated: Normally Non-Reactive; Vaccinated: Normally Reactive  
**Turnaround time:** 5 business days.

---

**Hepatitis C Antibody (HCV)**  
**Form 402**  
**Approved Submitters:** MSDH facilities  
**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube.  
**Volume/Amount Required:** 4 mL whole blood or 2 mL serum.  
**Collection Guidelines:** Collect whole blood in serum separator tube (SST) or plain red top tube. A SST tube can be accepted spun or unspun.  
**Storage Instructions:** Store refrigerated if possible until shipment, room temperature is acceptable.  
**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.  
**Test Method:** Chemiluminescence Immunoassay.  
**Test Availability:** Monday-Friday  
**Limitations:** A negative test result does not exclude the possibility of exposure to or infection with Hepatitis C virus. Results from immunosuppressed individuals should be interpreted with caution. Heterophilic antibodies in serum samples may cause interference in immunoassays.  
**Test Specific Causes for Rejection:** Specimens with less than 2 mL whole blood; specimens from patients less than 3 years of age; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.  
**Reference Value:** Normally Non-Reactive  
**Turnaround time:** 5 business days.  
**Critical Test Value:** All results in blood exposure incidents phoned to Health Care Providers immediately.
Human Immunodeficiency Virus 1 and 2 Antibodies and p24 Antigen Screen (HIV-1, 2 and p24)

Form 364

Approved Submitters: MSDH facilities

Sample Type: Serum, whole blood collected in plain (red top) or SST tube.

Volume/Amount Required: 4 mL whole blood or 2 mL serum.

Collection Guidelines: Do NOT centrifuge.

Storage Instructions: Store refrigerated if possible until shipment, room temperature is acceptable

Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Specimens must be received within 7 days of collection.

Additional Testing Information:

- Antibody testing is not recommended for children under 24 months of age.
- The testing sequence may take several weeks.
- A positive test does not necessarily indicate active infection; false positive tests can occur.
- Reflex confirmatory HIV Differentiation Assay by Enzyme Immunoassay (Geenius HIV 1/2 confirmatory assay) is performed on all samples demonstrating HIV 1,2 antibody reactivity.

An HIV-1 Nucleic Acid Amplification Test (NAAT by PCR) is performed on all specimens that are non-reactive for HIV 1-2, reactive for HIV antibodies-undifferentiated, and indeterminate for HIV-1 by the HIV Differentiation Assay.

Important:
For HIV Rapid Test confirmatory testing, mark Rapid Test Positive on request form. HIV 1,2 antibodies may be below detectable levels in Rapid Test positive patients with early infection.

No patient information or results can be given by the laboratory. Contact HIV/STD Program office at 601-576-7723.

Test Method: Chemiluminescence Immunoassay (4th generation screen), Enzyme Immunoassay Geenius), and Polymerase Chain Reaction (PCR).

Test Availability: Monday-Friday

Limitations:

- **Screen** Samples with total protein greater than 9g/dL may give false reactive results. Heterophilic antibodies in serum samples may cause interference in immunoassays. Levels of HIV antibodies may be undetectable in the early stages of infection. A negative test result does not exclude the possibility of exposure to or infection with HIV. Nonreactive results for an individual subject indicate absence of detectable HIV antibodies. However, a nonreactive test result does not preclude the possibility of exposure to or infection with HIV-1 and/or HIV-2. Nonreactive results can occur if the quantity of marker present in the sample is below the detection limits of the assay, or if the marker that is detected is not present during the stage of disease in which a sample is collected. False negative results may occur in individuals infected with HIV-1 and/or HIV-2 who are receiving highly active antiretroviral therapy (HAART).

- **NAAT**: Test has not been validated for use with patients receiving anti-retroviral therapy.

Test Specific Causes for Rejection: Specimens with less than 2 mL whole blood; specimens from patients less than 3 years of age; specimens with gross lipemia; specimens collected for more than 7 days and not refrigerated or frozen.

Reference Value: Normally Non- Reactive (Screen, Multispot); Normally Not Detected (NAAT).

Turnaround time: 10 business days.

Critical Test Value: All results in blood exposure incidents phoned to Health Care Providers immediately.
**Influenza A and B RT-PCR**

**Form 930**  
**Approved Submitters:** MSDH Influenza Surveillance Sites.  
**Sample Type:** Nasopharyngeal swabs and nasal specimens collected swab.  
**Collection Guidelines:** All respiratory specimens should be placed in viral transport media for shipment.  
**Storage Instructions:** Store at 2-8°C until shipment. Specimens should be submitted within 24 hours of collection to the laboratory for optimal testing.  
**Shipping Requirements:** Ship specimens with a cold pack in a RIGID outer container (Styrofoam box or cooler). DO NOT SHIP SPECIMENS IN AN ENVELOPE.  
* Specimens are shipped to the MPHL through the MSDH courier system. Please contact your district health department surveillance nurse or the State Influenza Coordinator at 601-576-7725 to ensure appropriate shipping arrangements through the MSDH courier system.  
**Additional Test Information:** Specimens should be collected from patients who are within 24-48 hours of symptom onset, have fever ≥ 100° F AND cough and/or sore throat (in the absence of a known cause other than influenza). Subtyping will be performed on all influenza positive specimens.  
**Test Method:** Reverse Transcription Polymerase Chain Reaction (RT-PCR).  
**Test Availability:** Monday-Friday  
**Limitations:** False negative results may occur if a specimen is improperly collected, transported or handled. Negative results do not preclude influenza virus infection and should not be used as the sole basis for treatment or other patient management decisions. An inconclusive test result may be due to amplification inhibitors or inadequate numbers of organisms present in the specimen. An invalid test result may be due to specimen contamination or inappropriate collection.  
**Test Specific Causes for Rejection:** Specimen received at room temperature; specimen not received in viral transport media.  
**Reference Value:** Normally Not Detected  
**Turnaround time:** 3-5 business days.  
**Critical Test Value:** All results of novel influenza strains are reported to Health Care Providers.  

*See Appendix J for complete collection instructions*

---

**Isolates -Confirmation and Grouping Including Salmonella, Shigella, E. Coli:O157, Non-O157 Shiga-toxin producing E. Coli, N. meningitidis, and H. influenzae**

**Form 402**  
**Approved Submitters:** All  
**Sample Type:** Pure isolates on solid medium (without sugars) in screw cap tube. MacConkey broth or GN broth acceptable for *E. Coli: O157* and other STEC isolates. (Ship broths on cold packs).  
**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.  
**Test Methods:** Conventional culture, biochemicals, and serological typing.  
**Test Availability:** Monday-Friday  
**Limitations:** Culture must be viable.  
**Reference Value:** Not Applicable  
**Turnaround time:** Bacterial isolation and identification can take up to 14 days; Salmonella typing can take up to 31 days.
La Crosse Encephalitis Virus Antibodies: see Arbovirus Screening

Lead Screening
Form 462
Approved Submitters: MSDH facilities
Sample Type: EDTA whole blood
Volume/Amount Required: 200 μL minimum
Collection Guidelines:
- Collect capillary blood in certified lead free EDTA microtainer devices. Use blue lancets provided by the laboratory.
- Collect venous blood in 3 mL certified lead-free K2, EDTA tan-topped tubes.
Obtain microtainer capillary blood collection devices from Central Supply. Obtain tan-top venous blood collection tubes from MPHL. Do not use collection supplies that have not been approved by the MPHL.
Storage Requirements: Samples may be stored at room temperature until shipping.
Shipping Requirements: Current shipping instructions for MSDH Contract Courier. Specimens must be received within 2 weeks of collection.
Test method: ICP-MS
Test Availability: Monday-Friday
Limitations: Specimens must be collected with MPHL-approved collection supplies and devices to avoid contamination with environmental lead.

Reference Ranges:

<table>
<thead>
<tr>
<th>Age Group</th>
<th>Reference Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Children 5 years of age or younger</td>
<td>Less than 5 μg/dL</td>
</tr>
<tr>
<td>Children 6 years of age or older and adults</td>
<td>Less than 10 μg/dL</td>
</tr>
</tbody>
</table>

Turnaround time: 5 business days

Critical Test Value: Results greater than 10 μg/dL are phoned to Health Care Providers immediately.
See Appendix K for complete collection instructions

Malaria, Blood Parasites
Form 402
Approved Submitters: All. Please notify lab before sending.
Sample Type: Thick and thin blood smears are accepted, EDTA whole blood (lavender top) is the specimen of choice.
Volume /Amount Required: Allow any size lavender top tube to completely fill, minimum half full. 1mL whole blood required for analysis.
Collection Guidelines: Invert whole blood tube gently 5-8 times after collection. Smears should be prepared immediately after collection and allowed to air dry thoroughly before packaging for shipment.
Storage Requirements: Ambient temperature, smears should be kept away from moisture.
Shipping Requirements: Current shipping guidelines for biological substances, Appendix E.
Test Methods: Giemsa Stain and microscopy.
Test Availability: Monday-Friday
**Limitations:** Specimen quality is dependent on the timing of specimen collection because parasitemia can fluctuate.

**Reference Value:** Normally Negative

**Turnaround time:** 5 business days, longer if sent to CDC.

**Critical Test Value:** All results phoned to Health Care Providers immediately.

---

### Measles Antibody, IgG and IgM

**Form 402**

**Approved Submitters:** All MSDH facilities for IgG; Office of Epidemiology only for IgM

**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube

**Volume/Amount Required:** 4mLs whole blood or 2 mLs serum

**Collection Guidelines:** Collect whole blood in serum separator tube (SST) or plain red top tube

**Storage Instructions:** Store refrigerated if possible until shipment. Specimens must be received within 24 hours of collection.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier

**Test Methods:**
- IgM Antibodies performed by Enzyme Linked Immunosorbent Assay (ELISA)
- IgG Antibodies performed by Enzyme Linked Fluorescent Assay (ELFA)

**Test Availability:** Monday-Friday

**Limitations:**
- **Measles IgG:** Assay should be used as a mean of determining the immune status of an individual.
- **Measles IgM:** The absence of detectable IgM antibody does not rule out the possibility of recent or current infection.

**Test Specific Causes for Rejection:**
- **IgG:** Collection tube submitted with less than 2 mLs whole blood for adults; gross lipemia; specimen collected in tubes containing additives such as EDTA or Heparin; specimen collected for more than 24 hours and stored or shipped at an ambient temperature; specimen collected for more than 5 days and not frozen at -20°C;
- **IgM:** Specimen grossly hemolyzed, grossly icteric or grossly lipemic

**Reference Value for IgG:** Unvaccinated: Normally Non-Reactive; Vaccinated: Normally Reactive

**Reference Value for IgM:** Normally Non-Reactive

**Turnaround time:** 2 working days

---

### Measles Virus RT-PCR

**Form 402**

**Approved Submitters:** All Office of Epidemiology approval required prior to submittal.

**Sample Type:** Throat or nasopharyngeal swabs placed in viral transport media; urine.

**Collection Guidelines:** Collect both specimen types (Throat or NP swab AND a Urine specimen) for PCR as soon as possible after rash onset (maximum 14 days after rash onset). Detection of measles RNA is most successful when samples are collected on the first day of rash through the 3 days following onset of rash.

**Collection Instructions:** A throat swab is preferred. NP swabs are acceptable but not preferred.
- **Throat swab:** Swab tonsillar areas and posterior nasopharynx. Use tongue blade to depress tongue to prevent contamination of swab with saliva. Place swab into 2-3 mL of transport media.
- **Nasopharyngeal swab:** Swab the nasal passage or the nasopharynx. Place swab into 2-3 mL of transport media.
• **Urine specimen:** Collect 10-40 mL of urine in a sterile urine specimen container. Have patient void directly into container, collecting from the first part of the urine stream if possible. First-morning voided specimens are ideal, but any urine collection is adequate.

**Storage Instructions:** Store at 2-8°C until shipment.

**Shipping Requirements:** Ship specimens with an ice pack in a RIGID outer container (Styrofoam box or cooler).

**Test Methods:** Reverse Transcription Polymerase Chain Reaction (RT-PCR).

**Test Availability:** Monday-Friday

**Limitations:** Failure to detect measles virus RNA by RT-PCR in samples from a person with clinically compatible measles symptoms does not rule out measles as a diagnosis. Successful detection of measles virus depends primarily on the timing of collection and quality of the clinical sample. Vaccinated individuals may shed virus for a shorter period and might shed smaller amounts of virus, thus degradation of the sample has greater consequences for successful detection of virus.

**Test Specific Causes for Rejection:** Specimen not refrigerated during transport; Use of improper swab (swab with calcium alginate or cotton tips and wooden shafts); swab not received in viral transport medium (dry swabs).

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days.

**Critical Test Value:** All results are phoned to Health Care Providers immediately.

**See Appendix H for complete collection instructions**

---

**Meningitis/Encephalitis Panel**

**Form 402**

**Approved Submitters:** All. Office of Epidemiology approval required prior to submittal.

**Sample Type:** 250 μL of CSF

**Collection Guidelines:**
- Do not centrifuge CSF after collection.
- Label a sterile, screw-capped tube with patient’s name (first and last), date of collection.
- Maintain sterility of specimen by storing at 2 – 8oC.
- Send to the laboratory within 24 hours of collection.

**Storage Instructions:** Store at 2-8°C.

**Shipping Requirements:** Ship specimens with an ice pack in a RIGID outer container (Styrofoam box or cooler).

**Test Methods:** Nested, multiplex PCR.

**Test Availability:** Monday-Friday

**Test Description:** The FilmArray Meningitis/Encephalitis (ME) Panel is a qualitative multiplexed nucleic acid-based *in vitro* diagnostic test capable of simultaneous detection and identification of multiple bacterial, viral, and yeast nucleic acids directly from cerebrospinal fluid (CSF) specimens obtained via lumbar puncture from individuals with signs and/or symptoms of meningitis and/or encephalitis. The following organisms are identified using the FilmArray ME Panel:

- **Bacteria:** *Escherichia coli* K1, *Haemophilus influenza*, *Listeria monocytogenes*, *Neisseria meningitidis* (encapsulated), *Streptococcus agalactiae*, *Streptococcus pneumonia*.
- **Viruses:** Cytomegalovirus, Enterovirus, Herpes simplex virus 1, Herpes simplex virus 2, Human herpesvirus 6, Human parechovirus, Varicella zoster virus.
- **Yeast:** *Cryptococcus neoformans/gattii*.

**Limitations:** The FilmArray ME Panel is indicated as an aid in the diagnosis of specific agents of meningitis and/or encephalitis and results are meant to be used in conjunction with other clinical, epidemiological, and
laboratory data. Results from the FilmArray ME Panel are not intended to be used as the sole basis for 
diagnosis, treatment, or other patient management decisions. Positive results do not rule out co-infection with 
organisms not included in the FilmArray ME Panel. The agent detected may not be the definite cause of the 
disease. Negative results do not preclude central nervous system (CNS) infection. Not all agents of CNS 
infection are detected by this test and sensitivity in clinical use may differ from that described in the package 
insert. The FilmArray ME Panel is not intended for testing of specimens collected from indwelling CNS 
medical devices. The FilmArray ME Panel is intended to be used in conjunction with standard of care culture for 
organism recovery, serotyping, and antimicrobial susceptibility testing.

Test Specific Causes for Rejection: Specimen not refrigerated during transport; Less than 250 μL of CSF 
received. Specimen received more than 6 days after collection.

Reference Value: Normally Not Detected

Turnaround time: 2 business days.

Critical Test Value: All results are phoned to Health Care Providers immediately.

Microsporidium: see Cryptosporidium

Mumps Virus RT-PCR
Form 402
Approved Submitters: All Office of Epidemiology approval required prior to submittal.
Sample Type: Buccal swab placed in viral transport media.
Collection Guidelines: See Appendix I for complete collection instructions.
Storage Instructions: Store at 2-8°C until shipment.
Shipping Requirements: Ship specimens with a cold pack in a RIGID outer container (Styrofoam box or 
cooler).
Test Methods: Reverse Transcription Polymerase Chain Reaction (RT-PCR).
Test Availability: Monday-Friday
Limitations: Failure to detect mumps virus RNA by RT-PCR in samples from a person with clinically 
compatible mumps symptoms does not rule out mumps as a diagnosis. Successful detection of mumps virus 
depends primarily on the timing of collection and quality of the clinical sample. Vaccinated individuals may 
shed virus for a shorter period and might shed smaller amounts of virus, thus degradation of the sample has 
greater consequences for successful detection of virus.
Test Specific Causes for Rejection: Specimen not refrigerated during transport; Use of improper swab (swab 
with calcium alginate or cotton tips and wooden shafts); swab not received in viral transport medium.
Reference Value: Normally Not Detected
Turnaround time: 2 business days.
Critical Test Value: All results are phoned to Health Care Providers immediately.
See Appendix H for complete collection instructions

Mumps IgG Antibody (Outbreak Investigation Use Only)
Form 402
Approved Submitters: MSDH facilities. Office of Epidemiology approval required prior to submittal.
Sample Type: Serum, whole blood in serum separator tube (SST) or plain red top tube.
Volume/Amount Required: 4 mL whole blood or 2 mL serum.
Collection Guidelines: Collect whole blood in serum separator tube (SST) or plain red top tube.
Storage Instructions: Store refrigerated if possible until shipment.
**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier. Specimens must be received within 24 hours of collection.

**Test Method:** IgG Antibodies performed by Enzyme Linked Fluorescent Assay (ELFA).

**Test Availability:** Monday-Friday

**Limitations:** Assay should be used as a means of determining the immune status of an individual. Because Mumps virus shares antigenic relationships with other viruses of the paramyxovirus groups, serologic cross reactions are possible.

**Test Specific Causes for Rejection:** Collection tube submitted with less than 2 mL of whole blood from an adult; gross lipemia; specimen collected in tubes containing additives such as EDTA or Heparin; specimens collected for more than 24 hours and stored or shipped at ambient temperature; specimen collected for more than 5 days and not frozen at -20 degrees; specimens grossly hemolyzed.

**Reference Value:** Unvaccinated: Normally Non-Reactive; Vaccinated: Normally Reactive.

**Turnaround time:** 2 business days.

---

**Mycobacteria, NTM:** see TB

---

**N. meningitidis:** see Isolates-Confirmation and Grouping

---

**Norovirus RT-PCR**

**Form 402**

**Approved Submitters:** All Office of Epidemiology approval required prior to submittal.

**Sample Type:** Stool or vomitus sample in a sterile container with no preservatives or media and a screw cap lid (i.e. sterile urine cup.). Stool samples submitted in Cary Blair transport media are also acceptable but are not the preferred samples type.

**Volume/Amount Required:** Minimum sample is a quarter size amount of solid stool, 1 mL of liquid stool, and 2 mL of vomitus. If stool is submitted in Cary Blair, fill container to fill line.

**Collection Guidelines:** Stool samples collected 24 - 48 hours after onset of symptoms are ideal.

**Storage Requirements:** After collection, specimens should be immediately refrigerated at 2-8°C,

**Shipping Requirements:** Ship on ice packs within 24 hours following current shipping guidelines for biological substances, Appendix E.

**Test Method:** Reverse Transcription Polymerase Chain Reaction (RT-PCR).

**Test Availability:** Monday-Friday

**Limitations:** Specimens should be collected within 48 to 72 hours after symptom onset when viral excretion is greatest. Norovirus can sometimes be detected in stool specimens collected later in the illness or after symptoms have resolved (up to 7 to 10 days after onset).

**Test Specific Causes for Rejection:** Specimen not refrigerated.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days.

---

**OCP (Ova, Cysts and Parasites)**

**Form 402**
**Approved Submitters:** All  
**Sample Type:** Stool collected in 10% formalin preservative. Please contact the lab for collection bottle and instructions.  
**Volume/Amount Required:** Add stool until formalin rises to fill line.  
**Collection Guidelines:** Completely emulsify stool using spork attached to lid. *Do not overfill the bottle. Fill only to the fill line.*  
**Storage Instructions:** Ambient temperature  
**Shipping Requirements:** Current shipping guidelines for biological substances, Appendix E.  
**Test Method:** Formalin Ethyl Acetate concentration and microscopy.  
**Test Availability:** Monday-Friday  
**Limitations:** The ability to detect parasites is limited by the quality of the specimen collection. A single negative specimen does not rule out parasitic infection.  
**Test Specific Causes for Rejection:** Specimen bottle over or under filled; Stool not emulsified.  
**Reference Value:** Normally Negative  
**Turnaround time:** 1-5 days.

### Parasites, Blood: see Malaria

**Pertussis (Whooping Cough) Culture**

**Form 402**
- Call lab for instructions.
- Transport media and calginate swabs must be obtained from lab.
- PCR is not performed on specimens submitted for culture.

**Test methods:** Conventional culture  
**Test Availability:** Monday-Friday  
**Limitations:** Culture must be viable and capable of growing in transport media.  
**Reference Value:** Normally Negative.  
**Turnaround time:** 10 business days

**Pertussis by PCR:** See *Bordetella species* (*B.pertussis, B. parapertussis, and B.holmesii*)

**PCR**

**Pinworm**

**Form 402**  
**Approved Submitters:** All  
**Sample Type:** “ScotchTape” Prep  
**Collection Guidelines:**
- Specimens should be collected at night when child is sleeping or in the morning prior to bathing.
- Use clear (not Magic brand) cellulose tape.
- Use only enough tape to cover top of slide. Do not wrap tape around slide.
• Using tongue depressor or equivalent, touch sticky side of tape strip to peri-anal region. Stick tape to clean microscope slide.
• Place in protective mailer or cardboard to prevent breakage.
• Place protective mailer containing slide in a ziplock biohazard shipping bag with requisition in the outer pocket.

**Storage Requirements**: Store at ambient temperature until shipped.

**Shipping Requirements**:
• Ship according to current shipping guidelines for biological substances, Appendix E.
• Do not mail in same package as pap smears.

**Test Method**: Microscopic observation.

**Test Availability**: Monday-Friday

**Limitations**: Clear tape must be used. Specimen quality depends on timing of collection. A single negative specimen does not rule out parasitic infection.

**Test Specific Causes for Rejection**: Frosted tape used; tape wrapped around slide.

**Reference Value**: Normally Negative

**Turnaround time**: 5 business days.

---

**Potassium**: see Chemistry Panel

**Pregnancy Testing**: see hCG, quantitative

**Quantiferon**: See TB EIA

---

**Rabies**

**Form 433**

**Approved Submitters**: Mississippi State Department of Health approval required prior to submittal.

**Sample Type**: Head only for medium and large animals (example dogs, cats, others); whole bats should be submitted to allow identification of species.

**Volume/Amount Required**: Animal head, whole bat.

**Collection Guidelines**: Humanely euthanize all animals prior to submittal. Submit the whole bat. Submit the head of all other animals after removal by trained veterinary staff. Veterinarians may submit the entire brain of the animal or labeled cross sections of the brain that clearly identify the cerebellum and brain stem. Cross-sections from the hippocampi may be submitted for the cerebellum when the latter is unavailable.

**Storage Requirements**: 2-8°C (do not freeze)

**Shipping Requirements**: See Appendix C for complete shipping information.

**Additional Testing Information**: Specimens should not be frozen because freezing delays and frequently compromises the examination.

**Test Availability**: Routine testing is available Monday –Friday during regular business hours. Weekend/holiday testing will be restricted to EMERGENCY SITUATIONS ONLY with Office of Epidemiology approval.

**Test Method**: Direct Fluorescent Antibody (DFA).
Limitations: Rabies infection may be focal, especially in large animals. Therefore, valid rabies results are dependent upon testing the medulla and the cerebellum or hippocampus from both hemispheres of the brain. Repeated sample freeze-thaw cycles may reduce test sensitivity and should be avoided.

Test Specific Causes for Rejection: Animal received decomposed. Fixation of animal tissue in formalin or other chemicals. Brain tissue that has been exposed to excessive heat. Animal head damaged and brain is unidentifiable or missing.

Reference Value: No particles characteristics of Rabies infection seen.

Turnaround time: 4 business days

Critical Test Value: All positives and unsatisfactory results are phoned to Submitter immediately.

---

Referral Tests

Form 402

Approved Submitters: MSDH program approval required prior to submittal.

Sample Type: Test specific requirements provided upon approval

Volume/Amount Required: Test specific requirements provided upon approval

Collection Guidelines: Test specific requirements provided upon approval

Storage Requirements: Test specific requirements provided upon approval

Shipping Requirements: See Appendix C for complete shipping information.

Additional Testing Information: A variety of referral services are available through the Public Health Laboratory for unique serology, molecular, culture, and microscope-based tests performed by the Centers for Disease Control (CDC). A complete patient history must be submitted with each specimen to avoid any delays in testing.

Test Availability: Routine referral testing is available Monday–Friday during regular business hours. Weekend/holiday testing will be restricted to EMERGENCY SITUATIONS ONLY with MSDH program approval.

Turnaround time: Varies depending upon event but routinely 5 business days for molecular and microscopic-based testing and 6 weeks for serology and culture testing.

Critical Test Value: All positive results are phoned to submitter or approving MSDH program immediately. Final reports are mailed to submitter upon receipt.

---

Respiratory Virus Panel

Form 402

Approved Submitters: All Office of Epidemiology approval required prior to submittal.

Sample Type: Nasopharyngeal swab in viral transport medium (VTM).

Volume/Amount: 300 μL sample swab in VTM.

Collection Guidelines: Swab must have a Dacron or Rayon tip with a flexible metal shaft or be a flocked swab with a plastic shaft. Swab must be placed in VTM with the cap securely tightened.

Storage Requirements: Store at 2-8°C until shipment. Specimens should be submitted within 24 hours of collection to the laboratory for optimal testing.

Shipping Requirements: Ship specimens with an ice pack in a RIGID outer container (Styrofoam box or cooler). DO NOT SHIP SPECIMENS IN AN ENVELOPE. Specimens are shipped to the MPHL through the MSDH courier system.

Additional Testing Information: The following organism types and subtypes are identified using the FilmArray RP: Adenovirus, Coronavirus 229E, Coronavirus HKU1, Coronavirus NL63, Coronavirus OC43, Human Metapneumovirus, Influenza A, Influenza A subtype H1, Influenza A subtype H3, Influenza A subtype H1-2009, Influenza B, Parainfluenza Virus 1, Parainfluenza Virus 2, Parainfluenza Virus 3, Parainfluenza...
**Virus 4, Human Rhinovirus/Enterovirus, Respiratory Syncytial Virus, Bordetella pertussis, Chlamydia pneumoniae, and Mycoplasma pneumonia.**

**Test Method:** nested, multi-plex PCR

**Limitations:** The detection and identification of specific viral and bacterial nucleic acids from individuals exhibiting signs and symptoms of a respiratory infection aids in the diagnosis of respiratory infection if used in conjunction with other clinical and epidemiological information. The results of this test should not be used as the sole basis for diagnosis, treatment, or other management decisions. Negative results in the setting of a respiratory illness may be due to infection with pathogens that are not detected by this test or, lower respiratory tract infection that is not detected by a nasopharyngeal swab specimen. Positive results do not rule out co-infection with other organisms: the agent(s) detected by the Film Array RP may not be the definite cause of disease. Additional laboratory testing (e.g. bacterial and viral culture, immunofluorescence, and radiography) may be necessary when evaluating a patient with possible respiratory tract infection.

**Test Specific Causes for Rejection:** VTM received without a swab. Dry swab, calcium alginate swab, swabs in bacterial transport systems or other body fluids will not be tested.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days

**Critical Test Value:** All positives and unsatisfactory results are phoned to Submitter immediately.

*See Appendix J for complete collection instructions*

---

**RPR (Syphilis Serology Screening test)**

**Form 450**

**Approved Submitters:** MSDH facilities

**Sample Type:** Serum or whole blood without additives.

**Volume/Amount:** 5 mL whole blood, 2 mL serum.

**Collection Guidelines:** Plasma is unacceptable.

**Storage Requirements:** Ambient temperature

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

**Additional Testing Information:** All reports for reactive specimens will include a titer and TP-PA confirmatory test for syphilis.

*Note that serologic tests for syphilis become reactive four to six weeks after infection or one to three weeks after appearance of the chancre. Tests performed before this time may be nonreactive.*

**Test Method:** Rapid Plasma Reagin (RPR).

**Test Availability:** Monday-Friday

**Limitations:** False positive RPR results may occur in autoimmune diseases and pregnancy. False negative RPR results may occur in immunocompromised individuals.

**Test Specific Causes for Rejection:** Specimen submitted in an EDTA, Sodium fluoride, or SST polymer gel blood collection tube; specimen hemolyzed; specimen other than serum (improper collection site); specimen lipemic; specimen greater than 5 days old; serum that has not been refrigerated.

**Reference Value:** Normally Non-Reactive

**Turnaround time:** 3 business days.

**Critical Test Value:** All reactive results on children less than 12 years old are phoned to Health Care Providers immediately.

---

**Salmonella:** see Enteric Culture or Isolates-Confirmation and Grouping
**Shigella: see Enteric Culture or Isolates-Confirmation and Grouping**

### SARS-CoV-2 Molecular Testing

**Form 1198**

**Approved Submitter:** MSDH

**Sample Type:** Nasopharyngeal (NP), oropharyngeal (OP: i.e. throat), nasal mid-turbinate, or nares/nasal in viral transport media or saline (PBS)

**Volume/Amount:** 2-3mL of either viral transport medium (VTM), Amies transport medium, or sterile saline

**Collection Guidelines:** All specimens must be placed in viral transport media for shipment.

**Storage Instructions:** Store at 2-8°C until shipment. Specimens should be submitted within 72 hours of collection to the laboratory for optimal testing.

**Shipping Requirements:** Ship specimens with a cold pack in a RIGID outer container packaged in compliance with Biological Substance, Category B, UN3373 requirements.

**Additional Test Information:** Specimens should be collected from patients who are within 24-48 hours of symptom onset, have fever \( \geq 100^\circ \text{F} \) AND cough and/or sore throat (in the absence of a known cause other than influenza). Subtyping will be performed on all influenza positive specimens.

**Test Method:** Reverse Transcription Polymerase Chain Reaction (RT-PCR).

**Test Availability:** Monday-Friday

**Limitations:** The sensitivity of the assay is dependent on the stage of the illness when the sample is collected, the quality of the specimen submitted, and the test's performance characteristics. SARS-CoV-2 is likely at higher viral loads in the upper respiratory tract (e.g. nasopharyngeal swab) during the first 3 to 5 days post onset of symptoms. The test is specific for severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2); therefore, the results do not exclude the possibility of infection with other respiratory viruses. An undetected (i.e. negative) result does not preclude infection with SARS-CoV-2 and should not be used as the sole basis for treatment or other patient management decisions. An inconclusive test result may be due to amplification inhibitors or inadequate numbers of organisms present in the specimen. An invalid test result may be due to specimen contamination or inappropriate collection. False negative results may occur if a specimen is improperly collected, transported, or handled.

**Test Specific Causes for Rejection:** Specimen received at room temperature; specimen not received in viral transport media.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2-3 business days.

**Critical Test Value:** All results of novel influenza strains are reported to Health Care Providers.

See Appendix P for complete collection instructions

### SARS-CoV-2 IgG

**Form 1198**

**Approved Submitter:** MSDH

**Sample Type:** Serum

**Sample Type:** Serum, whole blood collected in plain (red top) or SST tube.

**Volume/Amount Required:** 4 mL whole blood or 2 mL serum.

**Collection Guidelines:** Do NOT centrifuge.

**Storage Instructions:** Store refrigerated if possible until shipment, but room temperature is acceptable

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier. Specimens must be received within 2 days of collection.
**Test Method:** Reverse Transcription Polymerase Chain Reaction (RT-PCR).

**Test Availability:** Monday-Friday

**Limitations:** Results from antibody testing should not be used as the sole basis to diagnose or exclude SARS-CoV-2 infection or to inform infection status. A positive result may not indicate previous SARS-CoV-2 infection. Consider other information including clinical history and local disease prevalence, in assessing the need for a second but different serology test to confirm an immune response. Negative results do not rule out SARS-CoV-2 infection, particularly in those who have been in contact with the virus. Testing with a molecular diagnostic should be considered to evaluate for active infection in these individuals.

**Test Specific Causes for Rejection:** Specimens older than 48 hours at room temperature. Samples grossly hemolyzed. Specimen collected in expired devices. Specimens with quantities insufficient for testing

**Reference Value:** Normally Not Detected

**Turnaround time:** 3-5 business days.

---

**Sickle Cell screening:** see Hemoglobin Electrophoresis

**Sodium:** see Chemistry Panel

**St Louis Encephalitis Virus Antibodies:** see Arbovirus Screening

**Stool Culture:** see Enteric Culture

**Syphilis Serology:** see RPR, TP-PA, FTA

---

**TB EIA (QuantiFeron®TB Gold Plus Form 493)**

**Approved Submitters:** MSDH facilities and MPHL approved private submitters.

**Sample Type:** 1 Nil Antigen (Grey cap) tube, 1 TB1 Antigen (green cap) tube, 1 TB2 Antigen tube (yellow cap), and 1 Mitogen (Purple cap) tube should be collected per patient.

**Volume/Amount Required:** 1 mL (0.8 – 1.2 mL) of blood into each of the collection tubes (the black fill line on the side of the tube indicates the 1 mL fill mark). **Notes:** Tube will fill slowly. Under or over-filling of the tubes outside of the 0.8 to 1.2 mL range may lead to erroneous results.

**Collection Guidelines:** Blood collection tubes can be requested by contacting the TB Program. Antigens have been dried onto the inner wall of the blood collection tubes. Do not collect blood for QuantiFeron® testing on Friday unless correct incubation times can be assured.

**Incubation and Storage Requirements:** After filling, the contents of the tubes MUST be thoroughly mixed by firmly shaking. The tubes must be transferred to a 37°C ± 1°C incubator as soon as possible and within 16 hours of collection. Prior to incubation, maintain tubes at room temperature (22°C ± 5°C); Do not refrigerate or freeze the blood samples. Incubate the tubes **UPRIGHT** at 37°C for 16 to 24 hours. After incubation, tubes must be received within 72 hours and may be held between 4°C and 27°C. Do not centrifuge tubes prior to shipping.
**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

**Test Method:** Interferon Gamma Release Assay (IGRA).

**Test Availability:** Monday-Friday

**Limitations:** Cross-reactions may occur with *M. Kansasi*, *M. szulgai* or *M. marinum*. Indeterminate results may occur due to incorrect incubation, transport, or handling of specimens. Test results should be used with epidemiological history, medical status and diagnostic evaluations when diagnosing or excluding tuberculosis disease and assessing the probability of latent tuberculosis infection. Test performance has not been evaluated for individuals with compromised or altered immune systems, individuals younger than 17 years or pregnant women.

**Test Specific Causes for Rejection:** Specimen level not close to the indicator line on collection tube (blood level should be within ± 10% of black line); specimen not incubated properly; specimen received refrigerated, frozen or spun; specimen grossly hemolyzed.

**Reference Value:** Normally Negative

**Turnaround time:** 3 business days.

*See Appendix N for complete instructions*

---

**TP-PA (Syphilis Confirmatory testing)**

**Form 402**

**Approved Submitters:** MSDH facilities

**Sample Type:** serum

**Volume/Amount Required:** 5 mL whole blood in plain (red top) tube or 2 mL serum.

**Collection Guidelines:** Plasma is unacceptable.

**Storage Requirements:** see RPR, Serological Test for Syphilis, for sample collection and storage.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

**Additional Test Information:** TP-PA is performed when the RPR screening assay is reactive; this test is not performed as a stand-alone assay.

**Test method:** *Treponema pallidum* particle agglutination.

**Test Availability:** Monday-Friday

**Limitations:** TPPA tends to remain reactive following treponemal infection and should not be used to evaluate response to therapy.

**Test Specific Causes for Rejection:** Improper collection tube (EDTA, Sodium Fluoride, and SST polymer gel); specimen hemolyzed; improper collection site; specimen other than blood or serum; specimen lipemic.

**Reference Value:** Normally Non-Reactive

**Turnaround time:** 5 business days

**Critical Test Value:** All reactive results on children less than 12 years old are phoned to Health Care Providers immediately.

---

**Triglycerides:** see Chemistry Panel

---

**Tuberculosis (TB) and Other *Mycobacteria* Culture**

**Form 416**

**Approved Submitters:** MSDH facilities and private facilities approved by the MSDH TB Program.

**Specimen Types and Collection Guidelines:**

- **Sputum** A series of three specimens is recommended. Collect the specimens in the early morning on consecutive days. A volume of 3 to 10 mL is adequate for each specimen. Induced (or nebulized) sputum specimens are usually very watery, and unless indicated on the specimen submittal form, may...
be mistaken for saliva, which is an inappropriate specimen. Sputum swabs are unsatisfactory. Do not use any transport medium. Refrigerate specimen if transportation is delayed more than one day.

- **Bronchoalveolar Lavage Fluids and Bronchial Washings**: Collect at least 5 mL in a sterile container. Avoid contaminating bronchoscope with tap water. Saprophytic mycobacteria may produce false-positive culture or smear results. Refrigerate specimen if transportation is delayed more than one day.

- **Gastric lavages**: Collect 5 to 10 mL of fluid in a sterile container without a preservative, either early in the morning or eight hours after eating or drug therapy. Neutralize specimen within four hours of collection with 100 mg of sodium carbonate powder (Na$_2$CO$_3$). Do not use any transport medium.

- **Tissue (Lymph Node, skin, other biopsy material)**: Collect 1 g of tissue, if possible, aseptically. Select a caseous portion, if available. Do not immerse the specimen in saline (or other fluid) or wrap in gauze. Freezing decreases yield. A sterile container with a small amount of sterile water or sterile saline (to keep the specimen moist) is acceptable. Do not use any transport medium, preservative or fixative. Tissues in formalin are not acceptable.

- **Urine**: Collect catheterized or mid-stream urine voided in early morning. A minimum of 40 mL is recommended. Submit a series of three specimens, taken on three different days. Twenty-four hour cumulative specimens are unsatisfactory. Do not use any transport medium. Refrigerate specimen if transportation is delayed.

- **Feces**: Only fecal specimens from confirmed or suspected AIDS or other immunocompromised patients will be accepted. For firm specimens, collect approximately 1 gram feces. For more liquid specimens, collect 10-15 mL minimum in a sterile container.

- **CSF**: Submit CSF in sterile container. A minimum of 2 mL of CSF is required for culture and direct smear. Specimens submitted with a volume less than 2 mL will be processed for culture only. Do not use any transport medium. Use sputum mailer or equivalent meeting safety requirements.

- **Abscess Contents, Aspirated Fluid, Skin Lesions, Wounds**: Aspirate as much material as possible into a syringe with a luer tip cap. Place fluid into a sterile container. Specimens collected on swabs will be rejected. **Swabs are not recommended for the recovery of mycobacteria**.

- **Reference Isolates**: Submit pure culture of mycobacteria on Lowenstein Jenson (LJ) slant or other appropriate solid medium demonstrating good growth. Specimen submitted in liquid culture must be Acid Fast Bacilli smear-positive. Label the media with the patient's name and package carefully. If media is liquid, pack specimen with enough absorbent material to absorb the entire contents in case of breakage or leakage. **Ship specimens to the MPHL according to current shipping guidelines for Category A substances**. State site/source from which isolation was made and date of collection for the original, cultured specimen.

**Additional Collection and Shipping Information:**

- Please collect samples according to MSDH TB Program guidelines to prevent redundant testing.

- Sterile, leak-proof specimen containers are available upon request for the collection of clinical specimens requiring acid-fast bacilli stain and culture.

- Clinical specimens should be shipped to the MS PHL within 24 hours of collection for optimal recovery.

- Clinical specimens older than eight (8) days are unsatisfactory and will not be processed.

- If *M. haemophilum* or *M. genavense* is suspected, please contact the TB Lab prior to shipping the specimen(s) to ensure appropriate isolation procedures are utilized for these organisms.

- **Blood** and **Bone Marrow** specimens are not accepted.

**Test Methods and Procedures**

- **Digestion and Decontamination**: NALC/NaOH

- **Microscopic TB exam**: Fluorescent and/or Ziehl Neelsen stain.

- **Culture**: Clinical specimens are cultured using the automated Mycobacteria Growth Indicator Tube (MGIT) system and Lowenstein-Jensen slants.

- **Mycobacteria Species Identification**
- Species identification is accomplished using high-pressure liquid chromatography (HPLC) and/or nucleic acid probe tests.
- **Drug Susceptibility for M. tuberculosis complex** Primary drug susceptibilities are automatically performed on the first isolate of *M. tuberculosis complex* from an initial new positive patient and repeated at two-month intervals as long as patient remains culture positive. Testing is performed using the BACTEC MGIT 960 method. Testing can only be performed on pure cultures of *M. tuberculosis complex*.

**Test Availability:** Monday-Friday

**Limitations:** Organisms must be viable for culture studies. Delay in transport of specimen could compromise isolation of organism.

**Test Specific Causes for Rejection:** Unprocessed specimens older than 8 days from date of collection; gastric aspirates that were not buffered with 100 mg of sodium carbonate within 4 hours of specimen collection; pooled sputum or urine specimens; blood or bone marrow specimens; stool specimens from patients who are not known to be HIV positive; concentrates shipped at ambient temperature.

**Reference Value:** Normally Negative

**Turnaround time:** AFB smear results in 2 business days; clinical specimen culture isolation results in 14-50 days; reference isolate identification in 5-25 days; *Mycobacterium tuberculosis complex* drug susceptibility testing in 30-65 days.

**Critical Test Values:** Acid Fast Bacilli positive smears on new patients in last six months, positive MTB/RIF direct PCR test result and drug resistant *M. tuberculosis complex* results are phoned to Health Care Providers within 24 hours.

---

**Direct PCR test for *M. tuberculosis complex* (MTB/RIF)**

**Form 416**

**Approved Submitters:** MSDH facilities and private facilities approved by the MSDH TB Program

**Specimen Types and collection guidelines:**
The Cepheid GeneXpert assay is automatically performed on smear positive respiratory specimens from new patients with no previous history of tuberculosis infection in last twelve months. The MTB/RIF assay may also be performed on smear negative respiratory specimens from new patients upon special request by the treating physician. Document all assay special requests on the specimen submittal form to ensure that test is performed.

The MTB/RIF test is approved only for respiratory specimens (sputum, tracheal aspirates, and bronchial specimens) or the processed sediment (concentrates) of such specimens. Processed sediment (concentrates) requirements: Only respiratory specimen concentrates prepared from approved adaptions of the NALC-NaOH or NaOH decontamination protocols described by the CDC will be accepted. Resuspension fluids other than phosphate buffer (67mM, pH 6.8) or bovine albumin should not be used. Final specimen concentrations of NaOH other than 1% to 1.5% should not be used for processing specimens to be tested. Concentrates must be received on cold packs within 7 days of digestion/decontamination and must have been kept cold the entire 7 days.

**Test Method:** Polymerase Chain Reaction (PCR)

**Test Availability:** Monday-Friday

**Limitations:** The MTB/RIF assay is appropriate only for patients who are suspected of having pulmonary TB based on clinical evaluation. The MTB/RIF test must be performed and evaluated in conjunction with culture and clinical symptoms. Results may be affected by antecedent or concurrent antibiotic therapy. A negative MTB/RIF test does not exclude the possibility of isolating *M. tuberculosis complex* on culture. Inhibitory substances or contamination present in some specimens may prevent amplification and cause unreliable test results. A positive MTB/RIF test does not confirm the viability of mycobacteria. All results are presumptive and must be confirmed by standard practices of identification.
Testing is limited to respiratory specimens processed using the NALC-NaOH or NaOH decontamination protocols.

**Test Specific Causes for Rejection:** Unprocessed sputum or bronchial specimen received more than 3 days after the date of collection if stored at room temperature and more than 7 days if stored at 2-8°C; sputum or bronchial specimen sediments not received within 7 days after digestion and decontamination; non-respiratory specimens; specimen with obvious food particles or other solid particulates; grossly bloody specimens; specimens from patients known to be culture positive for MTBc or non-tuberculosis mycobacterium within the past 12 months; specimens that were concentrated by methods other than the current adaptation of the NALC-NaOH or NaOH decontamination protocols; sediments not received on cold packs; specimens that appear to be saliva; sputum specimens from patients currently being treated for TB for more than 3 days; requests for patients who are less than 18 yrs. of age.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days.

**Critical Test Values:** Positive results for MTB, with and without rifampin resistance are phoned to Health Care Providers immediately.

---

**Vaccinia (Non-variola Orthopox) by PCR**

**Form 402**

**Approved Submitters:** MSDH Facilities and private submitters approved by the MSDH Office of Epidemiology.

**Sample Type:** Vesicular swabs and scabs from crusted lesions.

**Collection Guidelines:** See appendix M

**Storage Requirements:** Samples may be stored at room temperature.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

Label the package to the attention of Molecular Diagnostics.

**Additional Test Information:** Please note the requested test as PCR for Vaccinia. Do not place swab or scab into transport medium; the specimen must be kept dry.

**Test Method:** Polymerase Chain Reaction (PCR).

**Test Availability:** Monday-Friday. With notification Saturday and Sunday testing is available.

**Limitations:** Reliable results are dependent on appropriate specimen collection and transport procedures.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days.

**Critical Test Value:** All results are phoned to Health Care Providers immediately.

*See Appendix M for complete collection instructions*

---

**Varicella-Zoster Virus (VZV) by PCR**

**Form 402**

**Approved Submitters:** MSDH Facilities and private submitters approved by the MSDH Office of Epidemiology

**Sample Type:** Vesicular swabs and scabs from crusted lesions.

**Collection Guidelines:** See Appendix L

**Storage Requirements:** Samples may be stored at room temperature.

**Shipping Requirements:** Current shipping instructions for MSDH Contract Courier.

Label the package to the attention of Molecular Diagnostics.
**Additional Test Information:** Please note the requested test as PCR for VZV. Do not place swab or scab into transport medium; the specimen must be kept dry.

**Test Method:** Polymerase Chain Reaction (PCR).

**Test Availability:** Monday-Friday

**Limitations:** Reliable results are dependent on appropriate specimen collection and transport procedures.

**Reference Value:** Normally Not Detected

**Turnaround time:** 2 business days.

**Critical Test Value:** All results are phoned to Health Care Providers immediately.

See Appendix L for complete collection instructions

---

**Vibrio:** see Cholera

---

**W**

**West Nile Virus Antibodies:** see Arbovirus Screening

---

**Whooping Cough:** see Pertussis

---

**Y**

**Yersinia pestis**

**Form 402**

**Approved Submitters:** MS Sentinel Laboratories, Law Enforcement, MSDH Office of Emergency Preparedness and Response.

**Sample Type:** Clinical Specimens- aseptically collected lymph node tissue or aspirate, tissue from liver, spleen, or lung, whole blood in EDTA, sputum, pleural fluid, and transtracheal aspirates or washes.

**Culture:** pure growing culture on a appropriate agar slant in a screw capped tube; blood culture.

**Environmental samples** submitted by law enforcement personnel.

**Volume/Amount Required:** Sputum and all liquid specimen volumes must equal at least 1 mL.

1 gram of tissue.

**Collection Guidelines:**

- **Tissue**
  - Tissue pieces should be collected and kept moist. Transport in sterile container at room temperature within 1 hour of collection.

- **Whole Blood (PCR only)**
  - Allow any size EDTA (lavender top) tube or serum separator tube to completely fill, half full minimum.

**Storage Instructions:** Clinical specimens should be stored at 2-8°C. Isolates and environmental samples should be stored at room temperature.

**Shipping Requirements:** Ship all clinical specimens on cold packs within 24 hours of collection using current shipping guidelines for biological substances, Appendix E. Ship all isolates at room temperature using current shipping guidelines for biological substances, Appendix E.

**Additional Test Information:** Notify MPHL Bioterrorism Coordinator or MPHL Special Microbiology Section at 601-576-7400.

**Test Method:** Conventional culture and Polymerase Chain Reaction (PCR).

**Test Availability:** Tested Monday-Friday. With notification, Saturday and Sunday testing available.

**Limitations:**
• **PCR:** If inhibitors are present in a DNA extraction, PCR assays may produce a false negative result. A false negative result may occur if a sample is improperly collected, transported or handled. False negative results may occur if inadequate numbers of organisms are present in the sample.
• **Conventional Culture and Biochemicals:** Organism must be viable for testing.

**Reference Value:** Normally Not Detected

**Turnaround time:** A preliminary report is available within 24 hours. A final report is available within 10 days.

**Critical Test Value:** All test results are reported to submitter.

See Appendix E for more shipping information

ENVIRONMENTAL SERVICES
TEST DESCRIPTIONS

Environmental Microbiology

Drinking Water Compliance sampling must be approved by the MSDH Bureau of Public Water Supply. Submission of public water supply samples will not be accepted from private individuals.

For status of regulated water systems, information on remedial actions for unsatisfactory samples, sample results and to register complaints contact the Bureau of Public Water Supply at 601-576-7518.

Drinking Water Microbiology – Coliform Presence/Absence test, MPN
Form 425, Form 427 Monitoring

- Submit sample in sterile bottle containing sodium thiosulfate provided by laboratory.
- Do not rinse bottle. Fill to 100 mL fill line as marked on the bottle. Samples will be rejected when sample volume is insufficient.
- Use the appropriate form and include all information requested on the form. Samples will be rejected should information be incomplete.
- Form 425 is for use by Public Water Systems (PWS)
- Form 427, Monitoring, is for use by MSDH Environmental Wastewater Region Offices, Central Office Food Protection, and Private (fee paid) Submitters.
- **Place appropriate matching barcode labels on sample bottle and form.** Barcode labels are provided to each Public Water System (PWS), MSDH Environmental Wastewater Region Office, and Central Office Food Protection by the Bureau of Public Water Supply. Place sample and form in shipping box. Barcode labels may be provided to Private (fee paid) Submitters by the Environmental Microbiology Laboratory.
- If a barcode is not available, matching unique ID numbers must be written on the bottle and form or the sample will be rejected.
- Samples may be shipped in cardboard boxes available from county health departments.
- Date and sign Custody Seals and place on box as directed in instructions on pages 83-84.
- Place Lab Mailing Label #477 on shipping box.
- Samples may be dropped off at county locations Monday through Wednesday for delivery to the laboratory via courier. The lab will not accept routine bacteriological samples on Friday or Saturday. Contact the Bureau of Public Water Supply for boil water and other special sample types.
- Samples may be delivered directly to the laboratory sample receipt room Monday through Thursday no later than 4:00 pm.
- Samples received in the laboratory more than 30 hours after collection will be rejected.
Bottled Water and Ice
Form 411
Fee for non-health department bottled water/ice plant samples by prearrangement with the laboratory and program office. For bottled water cap and container submissions contact the Environmental Microbiology Laboratory.

Bottled Water - Source Water - Coliform Presence/Absence test

- Submit plant source water sample in sterile bottle containing sodium thiosulfate provided by the laboratory.
- Do not rinse bottle. Fill to 100 mL fill line as marked on the bottle. Samples will be rejected when sample volume is insufficient.
- Use Form 411 and complete for all information requested. Samples will be rejected should information be incomplete. **Place appropriate matching barcode labels on each sample bottle and form.** Barcode labels are provided by the Public Health Laboratory. Place sample and form in shipping box.
- Samples may be shipped in cardboard water sample boxes available from county health departments. Place Lab Mailing Label #477 on shipping box.
- Samples must be received and tested within 30 hours of collection.

Bottled Water - Product Water – Total Coliform Most Probable Number (MPN) test

- For each product sample submit ten (10) product water containers; either ten sterile bottles provided by the laboratory filled with product collected throughout the day’s production run, or ten unopened retail containers selected at random from the lot/batch.
- Do not rinse lab supplied bottle. Fill to 100 mL fill line as marked on the bottle. Samples will be rejected when sample volume is insufficient.
- For each container submitted, complete a form 411 for all information requested. **Include batch number, lot number or production date on each form.** Samples will be rejected should information be incomplete.
- **Place appropriate matching barcode labels on each of the ten (10) sample bottles and forms.** Barcode labels are provided by the Public Health Laboratory.
- Samples may be shipped, Monday through Wednesday only, in cardboard water sample boxes available from county health departments. Place Lab Mailing Label #477 on shipping box.

Ice - Coliform Presence/Absence test

- Submit ice product sample in two (2) 100 mL sterile bottles containing sodium thiosulfate provided by the laboratory. Two bottles allow ample sample after volume change upon melting.
- Do not rinse bottle. Use Form 411 and complete for all information requested. Samples will be rejected should information be incomplete. **Place appropriate matching barcode labels on each sample bottle and form.** Barcode labels are provided by the Public Health Laboratory.
- Sample and form may be shipped, Monday through Wednesday only, in cardboard water sample boxes available from county health departments.
- Samples must be received and tested within 30 hours of collection.

Complaint/Monitoring samples must be submitted by an environmentalist.
The Bottled Water Program is monitored and regulated by the Office of Environmental Health. For complaints, contact the Office of Dairy and Bottled Water at 601-576-7606.
Recreational Surface Water – A1 Test
Form 410
Fee for non-health department sources by prearrangement with the laboratory.

- Contact the laboratory one week before samples are to be submitted.
- Submit sample in sterile bottle containing sodium thiosulfate provided by the laboratory.
- Do not rinse bottle. Fill to 100 mL fill line as marked on the bottle. Samples will be rejected when sample volume is insufficient.
- Use the appropriate form and include all information requested on the form. Samples will be rejected should information be incomplete. **Place appropriate matching barcode labels on sample bottle and form.** Barcode labels are provided by the Public Health Laboratory.
- Place the sample bottle in a large plastic bag; close with large rubber band; place inside bag that lines shipper; add crushed ice to fill remaining space in shipper. Shipper may be blue polyfoam shipper supplied by lab, or insulated shipper provided by the submitter. Do not allow sample bottle to have direct contact with ice. Protect sample submission form from water/ice by placing in lid or attaching to the outside of the shipping container.
- Temperature control identical to sample must accompany sample.
- Samples must be maintained at 10°C or below until analysis.
- **Special Note:** Samples not tested within 8 hours of collection will be reported with a disclaimer.
- Samples will be rejected if received 30 hours after collection.
- Samples may be shipped, Monday through Wednesday only, through the local health department by courier or delivered directly to the Public Health Laboratory. Place Lab Mailing Label #477 on shipping container.

Autoclave Sterility Check
Form 363
Health Department clinics and state certified private drinking water laboratories only.

Health Department Clinics: Submit test ampoules that have been treated according to the Monthly Autoclave Sterility Check Instructions in the Public Health Nursing Manual.

Drinking Water Laboratories: Submit test ampoules that have been treated according to instructions provide by the MPHL Lab Certification Officer.

- **Write lot number and expiration date of ampoule on completed form 363.**
- Wrap treated ampoules carefully in packing material, place the ampoules inside a zip-lock biohazard bag and place completed Form 363 in the outside pocket of the bag for shipping.
- Ship the same day as tested in a 2" X 5" unlined mailer, available from the laboratory. Label mailer, “Attention: Environmental Microbiology.”
- Ship Monday through Wednesday only.
- This is a 48-hour test. Please refer to holiday closure schedules before submitting.
**Heterotrophic Plate Count**  
**Form 427**  
State certified private drinking water laboratories only- by prearrangement with the laboratory

- Submit sample in sterile bottle containing sodium thiosulfate provided by the laboratory.
- Do not rinse bottle. Fill to 100 mL fill line as marked on the bottle.
- Temperature control identical to sample must accompany sample.
- Samples must be maintained at 4°C or below. Transport on ice or frozen cold packs. Protect sample bottle by placing in a sealed plastic bag. Do not allow sample bottle to have direct contact with ice.
- Complete Form 427, Drinking Water Microbiology Monitoring Sample. Write “HPC-Simplate MPN” on form. Form must include date and time of collection.
- Protect sample submission form from water/ice by placing in shipping container lid or attaching to the outside of the shipping container.
- Sample must be received within 24 hours of collection.

**Dairy Testing**  
Milk Program environmentalists only

- Milk sampling schedules are arranged by the Environmental Microbiology Supervisor and the Milk Environmentalists. Routine milk samples are not accepted Friday through Sunday. Samples must be received within 60 hours of collection. Refer to Milk Program for further instructions, interpretation of results, and regulatory actions.

**Raw Milk – Aerobic Plate Count, Coliform count, Microbial Inhibitor Assay, Antibiotic Residue, Electronic Somatic Cell Count, Somatic Cell Count**  
**Form 431**

- he submitter, complete and apply a lab supplied, Lab Sample ID label to top of sample vial
- Submit in plastic vial (available from lab) no more than three fourths full.
- When a sample vial does not have a vial top label applied by t for each sample and temperature control.
- Place sample vials in a large plastic bag; close with large rubber band; place inside bag that lines shipper; add crushed ice to fill remaining space in blue polyfoam shipper supplied by lab.
- Include temperature control in same size/type vial.
- Complete Form # 431 and place between outer and inner lids of shipper.
- Sample must be maintained at 0-4.5°C until analysis. Sample may not be frozen.

**Pasteurized Milk and Dairy Products (Finished Product) - Aerobic Plate Count, Coliform Count, Microbial Inhibitor assay, Antibiotic residue, Phosphatase, Butterfat, Freezing Point**  
**Form 430**

- Submit in unopened retail container.
- Ship in blue polyfoam shipper using procedure described under Raw Milk.
- Include temperature control which must be at least one half the size of the largest container.
- Complete Form # 430 and place between outer and inner lids of shipper.
- Sample must be maintained at 0-4.5°C until analysis. Sample may not be frozen.
Dairy Water-Well sample - Presence/Absence Coliform test
Glycol and Sweetwater-Multiple Tube Fermentation
Form 146

- Contact the Environmental Microbiology laboratory the day before submitting samples to allow time for media incubation.
- Submit sample in sterile bottle containing sodium thiosulfate provided by laboratory.
- Do not rinse bottle. Fill to 100 mL line or no higher than the curve in the neck of the bottle.
- Use the appropriate form and include all information requested on the form. Samples will be rejected should information be incomplete.
- **Place appropriate matching barcode labels on sample bottle and form.** Barcode labels are provided by the Laboratory.
- Place sample vials in a large plastic bag; close with large rubber band; place inside bag that lines shipper; add crushed ice to fill remaining space in blue polyfoam shipper supplied by lab.
- Include temperature control in same size sample bottle.
- Complete Form # 146 and place between outer and inner lids of shipper.
- Samples must be tested within 30 hours of collection.
- Sample must be maintained at 0- 4.5°C until analysis. Sample may not be frozen.

Environmental Inorganic Chemistry Testing for Private Submitters

Lead and Copper in Drinking Water
Form 478

Samples may be submitted by private citizens. Results cannot be used for compliance purposes. A fee will be charged.

- Contact the Public Health Lab Office Manager to order sample collection container, submission form and mailer.
- Before collection materials are sent to the requestor, the laboratory must receive a check payable to the Public Health Laboratory for $20 for **each** sample to be tested. Each sample will be tested for both lead and copper.
- Collect sample, complete sample submission form 478 for each sample. Submit in mailer per instructions provided.
- If multiple samples are sent, number or identify each sample according to location, time collected, etc.
- Samples may be shipped by courier from county health departments.

After testing, the laboratory will report results by mail to the submitter.
Drinking Water Compliance Testing for Public Water Systems
Environmental Inorganic Chemistry

Sampling must be approved and scheduled by the MSDH Bureau of Public Water Supply. Submission of public water supply samples will not be accepted from private individuals.

For status of regulated water systems, information on remedial actions for unsatisfactory samples, sample results and to register complaints contact the Bureau of Public Water Supply at 601-576-7518.

Drinking Water Fluoride
Form 428

- Submit sample in sterile bottle provided by laboratory.
- Do not rinse bottle. Fill to 100 mL fill line as marked on the bottle.
- Use the appropriate form and include all information requested on the form. Samples will be rejected should information be incomplete. **Place appropriate matching barcode labels on sample bottle and form.** Barcode labels are provided to each Public Water System (PWS) by the Bureau of Public Water Supply. Place sample and form in shipping box.
- If a barcode is not available, matching unique ID numbers must be written on the bottle and form or the sample will be rejected.
- Samples may be shipped in cardboard boxes available from county health departments.
- Date and sign Custody Seals and place on box as directed in instructions pages 83 & 84.
- Place Lab Mailing Label #477 on shipping box.

Suspected Drinking Water Contamination

Individuals concerned about drinking water supply contamination should contact the MSDH Office of Emergency Preparedness and Response (OEPR) at 601-576-7400 or the Department of Health Bureau of Public Water Supply at 769-798-4258. The MPHL in coordination with OEPR and Water Supply will perform analyses for pH, nitrites/nitrates, chlorides, sulfates, metals, volatile organic contaminants, fluoride, cyanides, pesticides, total coliform, and \textit{E. coli}. The MPHL tests only drinking water samples; all other water samples should be directed to the appropriate testing agency.

APPENDIX C

GENERAL RABIES TESTING INFORMATION

Requesting Rabies Testing

Rabies testing questions must be directed toward the closest County Health Department or District Health Office. The MPHL will test specimens ONLY after the requestor has consulted with the appropriate MSDH county clinic or district office staff and obtained testing approval. The MPHL will provide testing at no charge for exposure events associated with public health significance as a public service.

Animals that bite humans

Wild animals

Raccoons, skunks, foxes, and coyotes are the terrestrial animals most often infected with rabies in the United States. All bites by such wildlife must be considered a possible exposure to the rabies virus. Small rodents like squirrels, hamsters, guinea pigs, gerbils, chipmunks, rats, and mice as well as lagomorphs including rabbits and hares are almost never found to be infected with rabies and have not been known to transmit rabies to humans.

Domestic animals

Healthy dogs, cats and ferrets that bite a person, other pets or livestock should be confined and observed for 10 days instead of euthanized and submitted for testing. Such animals should be evaluated by a veterinarian at the first sign of illness during confinement, and if the illness is consistent with rabies or the animal dies, then the animal’s head should be removed and shipped on ice packs to the laboratory for rabies testing. Dogs, cats and ferrets that survive the 10-day quarantine period should not be submitted to the laboratory for rabies testing.

Bats

Indigenous rabid bats have been documented in all 49 continental states, including Mississippi. Bats that have interactions with people or domestic animals should be submitted for testing if contact with the bat involved a bite, handling where a bite cannot be ruled out, or bats that are found in a domicile with access to people or domestic animals when they were asleep, unconscious or incapacitated. If one or more bats escape capture, do not submit the remaining bats since recommendations regarding post-exposure prophylaxis will not be altered by testing only some of the bats.

Livestock and horses

Rabies testing should be performed on livestock and horses only if the animal has exposure to a known or suspected rabid animal. An owner of livestock or horse(s) suspected of having exposure to rabies should contact a veterinarian regarding the health of the animal(s) and the recommended tests. The MPHL will accept brain tissues or heads associated with exposed livestock and horses ONLY from the Mississippi Veterinary Research & Diagnostic Laboratory (Phone: 601-420-4700) or the Mississippi State University CVM Diagnostic Laboratory (Phone (662) 325-1104).

Refer to [http://www.cdc.gov/rabies/exposure/animals/domestic.html](http://www.cdc.gov/rabies/exposure/animals/domestic.html) for additional information from the CDC regarding the exposure risks associated with specific animal species.
Rabies Specimen Submission Guidelines

In general, only the following animals will be tested:
1. Wild animals (with the exception of rodents, rabbits or opossums) that bite/expose humans or domestic animals. Raccoons, skunks, foxes, and coyotes are the terrestrial animals most often infected with rabies in the United States.
2. Dogs, cats, or ferrets that bite/expose humans and cannot be confined for 10 days of observation or that do not survive the 10-day confinement period.
3. Bats that have interactions with people or domestic animals.

Animals other than bats

Only the head of animals other than bats will be accepted for rabies testing. The MPHL is not equipped for animal disposal or animal necropsy. All heads must be removed by a veterinarian. Attempting to improperly remove an animal head may compromise the integrity of the brain material, rendering the specimen unsatisfactory for testing. MPHL staff MUST be able to identify specific brain anatomy for accurate testing. Intact animals decompose more rapidly than just the animal heads, decreasing our ability to provide accurate results. All animals must be euthanized to avoid damage to the brain. Contact your local MSDH clinic or district office to discuss whether the animal should be tested for rabies and to receive instructions on what steps need to be taken next. Before bringing the specimen to your local MSDH site, TRIPLE bag the specimen (animal head only) and make sure each of the three bags are securely closed to prevent leakage. Place the triple-bagged specimen into a hard-sided or Styrofoam box and secure the lid. Keep the specimen cool with ice packs surrounding the bagged specimen. DO NOT FREEZE or have ice directly on the specimen.

Bats

Bats must be submitted whole for rabies testing to allow the lab staff to speciate the bats prior to testing. Because bats are one of the natural reservoirs of the rabies virus, all bats should be treated as if infectious. Never touch a bat with bare hands. If the bat is presumed dead, take caution in case the bat is merely stunned or asleep. Take care to not crush the bat’s skull. A damaged brain will render the bat unsatisfactory for testing. If unsure about the condition of the brain, continue with submission and the laboratory staff performing testing will make a final determination on the acceptability of the bat for testing. All efforts should be made to send only deceased bats. Submission of a live bat to the MPHL requires prior approval from the District Office AND the MPHL. In the event submission of a live bat becomes necessary, packaging and transport of the live bat will need to be addressed. However, the following general guidelines should be followed when submitting live bats:
1. Refer to http://www.cdc.gov/rabies/bats/contact/capture.html for the CDC’s guidance on how to capture a live bat. Anyone attempting to handle a live bat must always protect him/herself from potential bites by wearing impenetrable gloves.
2. The live bat should be contained in an escape-proof container (e.g. coffee can with tight fitting lid, or Tupperware container). Do not wrap the bat in anything that could hinder access to it (e.g. a cloth towel, packing material, etc.). Be sure to secure the lid COMPLETELY using duct tape if necessary, to prevent the bat from escaping; it only takes a tiny opening for a bat to squeeze through and escape.
3. Place the sealed container with the bat in standard leak-proof plastic bag with zipper closure and ensure bag is sealed. If necessary, place the bagged container in a second leak-proof plastic bag with a zipper closure.
4. Contact your local MSDH County clinic or District Office prior to arriving at the health department to receive approval for testing.
Specimen Shipment
All specimens MUST be shipped to the MPHL through a MSDH county clinic or district office. The MSDH has a courier system in place that will deliver the specimens the next day to the MPHL. The MPHL will not accept specimens directly from private citizens or veterinarians; all specimens MUST be screened for exposure risk at the MSDH County or district office. Individuals delivering specimens directly to the MPHL will be referred to their local health department clinic or district office for exposure evaluation.

Rabies Testing Procedure
When the laboratory tests an animal for rabies, technologists examine three areas of the brain: medulla (brain stem), cerebellum, and hippocampus. The laboratory must examine a complete cross section of the brain stem and either the cerebellum or hippocampus to be confident that adequate samples have been tested. If the animal head has been compromised due to trauma or decomposition, the laboratory may not be able to generate a valid result.

Turnaround Time and Reporting of Rabies Results
Routine Testing and Result Reporting of Rabies Specimens
- Specimens are tested daily Monday through Friday.
- Weekend and Holiday Testing and Result Reporting of Rabies Specimens
- Specimens are not tested on the weekend but do receive priority testing on the following Monday.
- Specimens received after 8:00 a.m. and prior to 3:00 p.m. the day before a holiday will be tested the next working day.
- Emergency weekend or holiday testing will be performed only with approval from the Office of Epidemiology.

Result Interpretation
Positive
Test results indicate that the specimen was positive for rabies virus. The MSDH will assist primary physician with determining if rabies prophylaxis is needed. Further information is available on the CDC website (http://www.cdc.gov/rabies/index.html).

Negative
Test results indicate that the specimen was negative for rabies virus. Post-exposure prophylaxis for rabies is not necessary following exposure to an animal that tested negative for the rabies virus. Further information is available on the CDC website (http://www.cdc.gov/rabies/index.html).

Unsatisfactory
When the laboratory tests an animal for rabies, the technologists examine three areas of the brain: stem, cerebellum, and hippocampus. To be confident that they have an adequate sample for testing, the laboratory must receive a complete cross section of the brain stem and either the cerebellum or hippocampus. If the required brain parts are not received, they test what was received. If that part is positive, the specimen is reported as positive. However, if the part received is not positive, the specimen is reported as unsatisfactory. This is necessary because testing fewer areas of the brain may not lead to detection of a weak positive animal. If you receive an unsatisfactory report, the MSDH Office of Epidemiology will assist the primary physician with determining whether or not rabies prophylaxis is needed.

Inconclusive
An inconclusive report indicates that when the animal was tested for rabies, some material in the brain of the animal looked suspicious but could not be definitively identified as rabies virus. Prior to issuing an inconclusive report, the specimen is retested multiple times. If you receive an inconclusive report for rabies,
the MSDH Office of Epidemiology will assist the primary physician with determining whether or not rabies prophylaxis is needed.

RABIES TESTING

MSDH SHIPMENT PROCEDURE FOR RABIES SPECIMEN

Specimens MUST be approved by the District Health Officer or designee prior to submission and in accordance with the Office of Epidemiology Manual. MSDH approved testing will be performed for exposure events deemed to meet public health significance. **Citizens may pay for private rabies testing on request if no human exposure risk is identified or if the exposure does not meet public health significance.**

**Specimen Shipment Requirements:**

Rabies specimens must be shipped to the MPHL in the designated MSDH rabies shippers. These shippers are grey, Thermosafe brand metal chests that are numbered and assigned to specific health department locations. The MSDH clinic or office staff that approved the testing is responsible for ensuring that rabies specimens are properly shipped. The MPHL will reject any specimens submitted in non-MSDH rabies shippers.

**Specimen Packaging Requirements:**

- Don personal protective equipment.
- Place specimen (animal head or whole bat) in a leak proof plastic bag with a zipper-type closure. Verify that the bag is sealed.
- Place the bagged specimen into second leak proof plastic bag with a zipper-type closure. Verify that the bag is sealed.
- Place double bagged specimen into rabies shipper. Ship only one (1) specimen per shipper.
- Place cold packs between outer (second) specimen bag and shipper. **DO NOT USE LOOSE OR DRY ICE.** Use sufficient cold packs, to maintain a cool environment, even with a delay of one full day.
- Specimens should arrive cold but not frozen. Frozen samples must completely thaw before processing; this can delay testing up to 24 hours.
- Place completed Rabies Test Requisition form (Form 433) in the pocket inside the lid of the shipper. **Samples will not be tested until a completed Form 433 is received.**
- Securely close shipper. Make sure shipping label shows Public Health Laboratory.
- Place shipper with other specimens for MSDH courier pick up at the health department.
- Complete the fillable PDF **MPHL Rabies Electronic Submission Notification Document** at [http://msdh.ms.gov/msdhsite/_static/resources/6814.pdf](http://msdh.ms.gov/msdhsite/_static/resources/6814.pdf). After all information is typed into the document, choose “send by email” to send the form to the MPHL and the Office of Epidemiology. The completion of this notification document is critical for the laboratory to monitor the arrival of rabies specimens and to be able to notify the submitter if a specimen does not arrive as expected. Shipments that fail to arrive at the laboratory require investigation not limited to contact with the submitter and verification of sample disposition with full documentation of these activities. Testing will be delayed for any specimen received without prior notification.
Materials Supplied by the Laboratory (Call 601-576-7582 to request supply restocks.)
1. Rabies shippers (please see picture below): Gray, Thermosafe brand chests. Shippers are to be used to transport animal carcasses and heads for rabies testing only. NO OTHER LABORATORY SAMPLES OR SUBMISSIONS ARE ALLOWED IN THESE SHIPPERS.
2. Disposable packing supplies: Each rabies shipper should contain a disposable lab coat, two Ziploc type bags, and a checklist for packing.
3. Rabies request forms: These forms are supplied using the standard procedure for laboratory requisitions. Ask for form number 433.

Materials Required but Not Supplied by the Laboratory
1. Disposable latex or plastic gloves.
2. Frozen cold packs. These may be obtained commercially or prepared by filling disposable plastic bottles with water and freezing. Every effort will be made by the laboratory to return commercial cold packs to the submitting health department location, but several should be kept on hand for multiple shipments and lost cold packs. Cold packs normally require at least 24 hours to freeze to enable appropriate shipping conditions.
3. Eye protection.
APPENDIX D

GUIDE FOR THE REFERRAL OF POTENTIAL AGENTS OF BIOTERRORISM

The Centers for Disease Control (CDC) has identified certain micro-organisms, toxins, and chemicals as having the potential to be used as agents of terrorism. CDC recognizes hospital laboratories as sentinel labs, and requests that all suspect terrorism samples be referred to the Mississippi Public Health Laboratory (MPHL) for identification, analysis, and/or coordination of shipment of the samples to CDC.

BIOTERRORISM

Potential Bioterrorism Isolates from Clinical Laboratories
Bacterial isolates of suspect bioterrorism agents submitted to MPHL require prior notification. Notification should be made by calling the MPHL Terrorism Response Coordinator or the Division of Special Microbiology at 601-576-7400.

Shipping instructions for bacterial isolates of suspect bioterrorism agents:

1. The Department of Transportation (DOT) regulates the interstate transportation by surface or air of infectious substances and diagnostic specimens in the United States at www.dot.gov or http://hazmat.dot.gov/ for the latest rules and regulations concerning shipping.
2. Properly packaged isolates may be taken to any county health department for delivery by MSDH contract courier. (See Appendix E for more information on packaging and shipping infectious substances.)
3. If more rapid transportation is warranted, the MS State Department of Health Office of Emergency Planning and Response (OEPR), in partnership with other state and local agencies will arrange transportation of samples.
4. The MSDH “List of Reportable Diseases and Conditions” requires immediate notification to the Office of Epidemiology when the following agents are suspected: *Bacillus anthracis*, *Yersinia pestis*, *Francisella tularensis*, *Brucella* species, *Burkholderia pseudomallei*, *Burkholderia mallei*, *Coxiella burnetti*, *Variola major* (smallpox), botulinum toxin, ricin, and staphylococcus enterotoxin:

Smallpox Patient Specimens
Call the Mississippi Public Health Lab and the Office of Epidemiology at 601-576-7400 before collecting and shipping any potential smallpox specimen.

*LOW to MODERATE RISK OF SMALLPOX* - If the febrile rash illness is classified as low to moderate risk according to CDC guidelines, request a Varicella PCR assay to be performed to rule out chickenpox. Shipping instructions for patient specimens with low to moderate risk of smallpox: Package and label according to DOT and IATA guidelines. The package may be taken to any county health department for courier transport to the Mississippi Public Health Lab.

*HIGH RISK OF SMALLPOX* – If the febrile rash illness is classified as high risk of smallpox according to CDC guidelines, immediately report to MSDH Office of Epidemiology and the Mississippi Public Health Lab 601-576-7400. If smallpox is still suspected after MSDH review, the case will be reported to CDC.

Shipping instructions for patient specimens with high risk of smallpox:
CDC must provide approval before a potential smallpox patient clinical specimen is shipped to CDC’s BSL4 lab in Atlanta. Once CDC has given approval for shipment, package and label the sample as an
Infectious Substance, Category A according to DOT and IATA guidelines. **Specimens from patients with a high risk of smallpox should not be shipped to the Mississippi Public Health Lab.**

**Environmental Samples (Powders)**

Hospital laboratories should not process environmental (non-clinical) samples received from a possible bioterrorism event, especially powders. Individuals who possess environmental samples associated with a terrorism event should contact their local law enforcement agency.

**Sample Collection Guidelines for First Responders**

Bioterrorism samples should be collected and submitted to the MPHL as described below to ensure that the samples are submitted in a manner that promotes safety for all agency staff and preserves legal chain of custody.

**Field Testing Requirements**

1. MSDH Form 397, Field Testing for First Responders, will be completed to document all field testing performed on samples being submitted for bioterrorism testing. The form can be downloaded as a PDF at: [http://msdh.ms.gov/msdhsite/static/resources/2049.pdf](http://msdh.ms.gov/msdhsite/static/resources/2049.pdf)
2. Samples should be field tested for the following: radiological agent, explosive agent, chemical agent, biological agent, or nerve agent.
3. The equipment used, type of testing conducted, and the result of testing should be documented on MSDH Form 397.
4. **Laboratory staff will not accept environmental terrorism suspect samples into the laboratory building without a completed MSDH Form 397.**

**Environmental Sample Packaging Requirements**

1. Unopened packages or letters are not accepted by the Mississippi Public Health Laboratory for bioterrorism testing. Letters and packages must be opened by local qualified emergency response assets or Office of Emergency Planning and Response (OEPR) Alpha Level Responders before they will be accepted.
2. Samples will not be accepted from the general public. **Samples will only be accepted when delivered by MSDH OEPR staff, pre-designated MSDH staff, FBI agents, Postal Service Inspectors, Civil Support Team (CST) members or other official law enforcement or governmental agency representative.**
3. Sample packaging dimensions must be less than 12” on all sides. **Packages larger than the specified dimensions will not be accepted for testing.**
4. Sample packaging must meet the below standards minimally:
   - Double bagged in zip lock type bags inside a sturdy outer container.
   - The outer container will be leak proof and able to maintain integrity if dropped while in transit.
   - The outside of the package will be thoroughly decontaminated to assure safe handling.

**Sample Delivery Requirements**

1. The laboratory bioterrorism team will be alerted at least 60 minutes prior to expected delivery.
2. The specific sample delivery location will be given prior to sample delivery.
3. **BEFORE allowing any samples into the building, the laboratory staff will examine MSDH Form 397 and the submitting law enforcement agency’s chain of custody documentation for completeness. The MPHL will keep a copy of the submitting agency’s chain of custody documents and return the original to the submitter.**
4. The laboratory staff will also examine the size and packaging of the sample **BEFORE allowing it into the building.**
CHEMICAL TERRORISM

Clinical Samples
LRN sentinel labs should call the MPHL Terrorism Response Coordinator at 601-576-7400 prior to submitting samples from a potential chemical exposure. Sample integrity using chain of custody documentation must be maintained during collection, storage, and shipment of these specimens.

The CDC lists sixty-four chemicals that are potential warfare agents. Clinical samples (blood and urine) from patients possibly exposed to such chemicals should be shipped to the MPHL for analysis. The MPHL can detect exposure to a number of toxic chemical agents, including cyanide, nerve agents and toxic metals.

Visit http://msdh.ms.gov/msdhsite/_static/14,0,188,614.html#Terrorism for MPHL specimen collection guidelines.

All IATA and DOT shipping guidelines should be followed when submitting suspect chemical terrorism samples to the MPHL. Please see Appendix E for additional shipping information.

If the Office of Epidemiology decides the situation warrants rapid transportation, the Office of Emergency Response, in partnership with other state and local agencies, will arrange transportation of clinical samples associated with a suspected terrorist threat. The samples should be routed to the Mississippi Public Health Laboratory as quickly as possible.

If the exposure risk warrants overnight shipment using an express courier, please ship the samples to:

MPHL Terrorism Response Coordinator
Mississippi Department of Health
Public Health Laboratory
570 East Woodrow Wilson
Jackson, MS 39216
APPENDIX E
GUIDELINES FOR CLINICAL SERVICES SPECIMEN SHIPPING

The MPHL accepts specimens for clinical services from health department and non-health department submitters. Submitters include clinics operated by the MS State Department of Health, private hospitals, reference laboratories, physician’s offices, correctional facilities, and law enforcement officials. Submitters ship specimens to the MPHL through the following three transportation systems: a contracted MSDH courier service, private hospital and reference laboratory courier services, and private commercial delivery services. The Department of Transportation regulates the transportation of infectious substances, including specimens and cultures by surface and air in the United States. See http://www.phmsa.dot.gov/ or http://www.phmsa.dot.gov/ for the latest rules and regulations concerning shipping. (Using the search function with “infectious substance” as the keyword will generally locate the Transporting Infectious Substances Safely brochure.) The print version is also available from DOT free of charge. Phone: (202) 366-2301; Fax: (202) 366-7342; Email: training@dot.gov.

This brochure contains definitions for Category A and Category B infectious substances, a classification flowchart, a list of Category A infectious substances and packaging and labeling requirements (§173.196(b)).

MSDH Contract Courier System
All submitters may ship specimens to the MPHL through the contracted MSDH courier system. Within the MSDH courier system, the health department clinics function as a submitter for health department patient samples and as a site for non-health department submitters located in the geographical areas to drop-off pre-packaged samples for transportation to the MPHL at no charge. The health department clinics are not responsible for the packaging of non-health department samples. Non-health department submitters should verify that all specimens are packaged as required by all Department of Transportation (DOT) regulations prior to delivery to the health department clinics.

Private Hospital and Reference Laboratory Courier Service
Private hospitals and reference laboratories may utilize their own courier service for sample delivery. Samples should be packaged, marked, labeled, and transported according to DOT regulations. The MSDH is not responsible for the operations of any private courier service. Refer to Appendix Q for local delivery instructions.

Commercial Delivery Services
Submitters may ship pre-approved specimens to the MPHL through commercial delivery services. Submitters are responsible for complying with all shipping regulations. The submitter should contact the commercial carrier for shipping requirement questions. Some commercial carriers require compliance with International Air Transport Association (IATA) regulations which are published in the IATA Dangerous Goods Regulations, whether the package is being shipped by air or by ground (http://www.iata.org/).

Submitter Shipping Responsibility
Regardless of the shipping system utilized, the submitter is responsible for shipping specimens in conformance with all safety and labeling regulations, including the proper classification of specimens and cultures for transport. Failure to ship specimens as required by shipping regulations may evoke severe penalties against the shipper. Review each test section provided in this guide for additional test-specific shipping instructions. Specimens and Cultures Shipped through the MSDH Courier System are shipped by ground transport and are regulated by the Department of Transportation (DOT).
Class 6, Division 6.2 Infectious Substances

1. **Category A:** (49 CFR 173.134) “An infectious substance in a form capable of causing permanent disability or life-threatening or fatal disease in otherwise healthy humans or animals when exposure to it occurs. An exposure occurs when an infectious substance is released outside of its protective packaging, resulting in physical contact with humans or animals. Classification must be based on the known medical history or symptoms of the source patient or animal, endemic local conditions, or professional judgment concerning the individual circumstances of the source human or animal. Category A poses a higher degree of risk than Category B.” The proper shipping name and identification number for Category A infectious substances is Infectious substances, affecting humans, UN2814. A shipper’s declaration is required for all Category A packages.

   **Shipping Instructions:** Category A infectious substances may be brought to the county health departments for transport to the Public Health Lab by the MSDH contract courier service. Samples must be packaged, marked, and labeled by trained, certified persons according to 49 CFR parts 173.196 before being transported by State Contract Courier.

2. **Category B:** (49 CFR 173.134) “An infectious substance not in the form generally capable of causing permanent disability or life-threatening or fatal disease in otherwise healthy humans or animals when exposure to it occurs. This includes Category B infectious substances transported for diagnostic or investigational purposes.” The proper shipping name and identification number are Biological Substance, Category B, UN3373.

   **Shipping Instructions:** Category B infectious substances (specimens and cultures not meeting the criteria of Category A) may be brought to the county health departments for transport to the Public Health Lab by the MSDH Contract Courier Service. Samples must be properly packaged in accordance with DOT regulations 49 CFR part 173.199 prior to delivery to a local Health Department.

3. **Frozen Specimens** – Since primary and secondary packaging containers must be air-tight, always place dry ice outside of secondary packaging. Dry ice should never be placed inside any other air-tight container. Anytime dry ice is used, the miscellaneous hazard label and the net quantity in Kg of the dry ice should be on the outside of the package.
SHIPPING GUIDELINES FOR HEALTH DEPARTMENT SUBMITTERS

Guidelines for Packaging Biological Substances, Category B (formerly Biological substances) for Transport by the Contract Courier Service

1. Specimen containers must be leak-proof for liquid specimens and sift-proof for solid specimens. Screw caps may be secured with Parafilm®. The maximum quantity for an individual specimen container is 500 mL or 500 g.

2. Place each specimen container, i.e. blood tube, in a zip-lock biohazard bag. **One specimen per bag!**

3. If the specimen is liquid, place adequate absorbent material inside the bag to absorb all of the contents in the event of a spill. (Most biohazard bags provided by the MSDH Public Health Laboratory contain a sheet of absorbent that is sufficient to absorb at least 50 mL.)

4. **Zip** the bag so that the zip lock bag is a leak-proof secondary container.

5. Place the test requisition facing outward in the pocket of the bag.

6. After each specimen is placed in a separate biohazard bag, sort specimens by test. For example, place RPRs in a larger zip lock bag or wrap a large rubber band around all HIVs.

7. Place all zip lock bags in a rigid transport box, meeting minimum testing requirements. (Each complete outer package must be capable of successfully passing a drop test of not less than 1.2 m (3.9 feet) and must be at least 100 mm (4 in) in the smallest overall external dimension.)

8. Specimens must be secured in the transport box with suitable cushioning material.

9. Secure the lid of the transport box.

10. If not using rigid shipping totes supplied by the laboratory, the shipment should be packed, marked, and labeled according to DOT regulations for Class 6, Division 6.2 Infectious Substances. Refer to 49 CFR 173.134.

11. Each person who packages a clinical specimen for transport must be familiar with the DOT regulations for the transport of biological substances. Certification of shipping training is not required for specimens classified as Biological Substances, Category B.

12. Clinical specimens from private submitters delivered to the health department for transport to the MPHL should be placed in the laboratory shipping tote by health department staff.
MSDH QUICK REFERENCE FOR CLINICAL SPECIMEN PACKAGING

1. Assemble a new biohazard bag, a completed laboratory request slip from Epic (if needed) and the sample. Don appropriate personal protective equipment. Always observe Universal Precautions when handling human specimens.

2. Compare patient information on the sample with the information on the request slip (if needed). They must match exactly. If possible, get a coworker to check behind you.

3. If included, fold request slip with the patient information facing out and insert into the side, not zippered, pocket of the biohazard bag with patient information facing OUT.

4. Place the specimen into the zippered pocket of biohazard bag. Make certain the specimen and the request slip (if included) match.

5. Seal zippered pocket of the biohazard bag. Double check to assure seal is leak proof.

6. For test with multiple samples, rubber band together by test. Place in approved rigid laboratory shipping tote.
APPENDIX F

APTIMA ® COMBO 2 ASSAY COLLECTION PROCEDURE FOR GC and CT

A. Test Purpose
APTIMA ® Combo 2 Assay is a nucleic acid amplification test (NAAT) that detects and differentiates infection by Chlamydia trachomatis and/or Neisseria gonorrhoeae in endocervical and male urethral swab specimens, in vaginal swab specimens and in female and male urine specimens. The assay may be used to test specimens from symptomatic and asymptomatic individuals. Different collection and transport kits may be required for different collection sites.

Test Disclaimers:
Medico-legal specimens are not to be collected using this technology (NAAT) as they are not admissible in court. Clients 12 years old or younger who are not currently enrolled in family planning programs are required to be assessed/consulted by physician prior to specimen collection.

B. Urine Specimen Collection

- Materials Required:
  Aptima Urine Specimen Collection Kit for Male and Female Urine Specimens

- Specimen Collection:
The client should not have urinated for at least 1 hour prior to specimen collection. Female patients should not cleanse the labial area prior to providing the specimen. Instruct patient to provide a first-catch urine (approximately 20 mL to 30 mL or the initial urine stream) into a urine collection cup. Collection of larger volumes of urine may result in specimen dilution that may reduce test sensitivity.

- Packaging, Transporting, and Storage of Urine Specimens
  After collection, urine samples must be transferred to the urine specimen transport tube immediately and placed inside of a biohazard bag with the completed Form 984. Remove the cap from the urine transport tube and transfer 2 mL of urine into tube using a disposable pipette. The correct volume of urine has been added when the fluid level is between the black fill lines on the urine specimen transporter tube label. Re-cap the urine specimen transport tube tightly and place a label with the client identification information. All urine samples MUST be transported to the laboratory in the GEN-PROBE APTIMA® URINE transport tube. Transport and store the GEN-PROBE APTIMA® URINE transport tube with the urine specimen at 2° to 30°C until tested.

C. Vaginal Swab Specimen Collection

Note: For patient-collected vaginal swab specimen collection, ensure that patients read the Patient Collection Instructions before providing them with a collection kit.

- Materials Required
  Aptima® Multitest Swab Specimen Collection Kit

- Wash hands before beginning the collection of vaginal swab.
- Partially peel open the swab package. Remove the swab. Do not touch the soft tip or lay the swab down. If the soft tip is touched, the swab is laid down, or the swab is dropped, use a new Aptima Multitest Swab Specimen Collection Kit. 2.
• Hold the swab, placing your thumb and forefinger in the middle of the swab shaft covering the score line. Do not hold the swab shaft below the score line.
• Carefully insert the swab into the vagina about 2 inches (5 cm) past the introitus and gently rotate the swab for 10 to 30 seconds. Make sure the swab touches the walls of the vagina so that moisture is absorbed by the swab and then withdraw the swab without touching the skin.
• While holding the swab in the same hand, unscrew the cap from the tube. Do not spill the contents of the tube. If the contents of the tube are spilled, use a new Aptima Multitest Swab Specimen Collection Kit.
• Immediately place the swab into the transport tube so that the score line is at the top of the tube.
• Carefully break the swab shaft at the score line against the side of the tube.
• Immediately discard the top portion of the swab shaft.
• Tightly screw the cap onto the tube.
• Wash hands after completion of the swab collection.
• Provide the closed container to the nurse.

D. Penile Meatal Swab Specimen Collection and Handling

Note: For patient-collected penile meatal swab specimen collection, ensure that patients read the Patient Collection Instructions before providing them with a collection kit.

• Wash hands before beginning the collection of penile swab.
• Partially peel open the swab package. Remove the swab. Do not touch the soft tip or lay the swab down. If the soft tip is touched, the swab is laid down, or the swab is dropped, use a new Aptima Multitest Swab Specimen Collection Kit.
• Hold the swab, placing your thumb and forefinger in the middle of the swab shaft covering the score line. Do not hold the swab shaft below the score line.
• Roll the swab on the tip of the penis, outside the opening of the penis (hole through which urine is passed). It is not necessary to put the swab inside the opening of the penis. Make sure to roll the swab all the way around the opening of the penis to get the best sample. Ensure the swab does not touch any other area of the skin.
• While holding the swab in the same hand, unscrew the cap from the tube. Do not spill the contents of the tube. If the contents of the tube are spilled, use a new Aptima Multitest Swab Specimen Collection Kit.
• Immediately place the swab into the transport tube so that the score line is at the top of the tube.
• Carefully break the swab shaft at the score line against the side of the tube.
• Immediately discard the top portion of the swab shaft.
• Tightly screw the cap onto the tube.
• Wash hands after completion of the swab collection.
• Provide the closed container to the nurse.

E. Pharyngeal Swab Collection

Note: For patient-collected throat swab specimen collection, ensure that patients read the Patient Collection Instructions before providing them with a collection kit.

• Wash hands before beginning the collection of pharyngeal swab.
• Partially peel open the swab package. Remove the swab. Do not touch the soft tip or lay the swab down. If the soft tip is touched, the swab is laid down, or the swab is dropped, use a new Aptima Multitest Swab Specimen Collection Kit.
• Hold the swab, placing your thumb and forefinger in the middle of the swab shaft covering the score line. Do not hold the swab shaft below the score line.
• Carefully insert the swab into the throat ensuring contact with bilateral tonsils (if present) and the posterior pharyngeal wall, then withdraw the swab without touching the inside of the cheeks or tongue.
• While holding the swab in the same hand, unscrew the cap from the tube. Do not spill the contents of the tube. If the contents of the tube are spilled, use a new Aptima Multitest Swab Specimen Collection Kit.
• Immediately place the swab into the transport tube so that the score line is at the top of the tube.
• Carefully break the swab shaft at the score line against the side of the tube.
• Immediately discard the top portion of the swab shaft.
• Tightly screw the cap onto the tube.

F. Rectal Swab Specimens Collection and Handling

Note: For patient-collected rectal swab specimen collection, ensure that patients read the Patient Collection Instructions before providing them with a collection kit.

• Wash hands before beginning the collection of rectal swab.
• Partially peel open the swab package. Remove the swab. Do not touch the soft tip or lay the swab down. If the soft tip is touched, the swab is laid down, or the swab is dropped, use a new Aptima Multitest Swab Specimen Collection Kit.
• Hold the swab, placing your thumb and forefinger in the middle of the swab shaft covering the score line. Do not hold the swab shaft below the score line.
• Carefully insert the swab into the rectum about 1-2 inches (3-5 cm) past the anal margin and gently rotate the swab for 5 to 10 seconds. Withdraw the swab without touching the skin.
• While holding the swab in the same hand, unscrew the cap from the tube. Do not spill the contents of the tube. If the contents of the tube are spilled, use a new Aptima Multitest Swab Specimen Collection Kit.
• Immediately place the swab into the transport tube so that the score line is at the top of the tube.
• Carefully break the swab shaft at the score line against the side of the tube.
• Immediately discard the top portion of the swab shaft.
• Tightly screw the cap onto the tube.
• Wash hands after completion of the swab collection.
APPENDIX G

MUMPS VIRUS PCR SPECIMENT COLLECTION PROCEDURE
Notify the Office of Epidemiology prior to shipping Mumps PCR samples

Preferred specimen: The preferred specimen is a buccal swab collected in viral transport medium within 9 days of onset of symptoms. **Collect the Mumps buccal sample using the viral transport flu kit that is provided for the collection of Influenza specimens for testing by PCR.**

Collection Procedure:
1. Buccal swab specimen should be collected only with a Dacron® or other synthetic tip and a wire shaft. **Swabs with calcium alginate or cotton tips and wooden shafts are unacceptable.**
2. Collect buccal fluid by swabbing the buccal cavity (the space between the cheek and teeth). The parotid duct drains in this space near the upper molars. Massage the parotid gland area just in front of the ear and near the angle of the jaw for 30 seconds prior to collecting secretions on the swab. Swab the area between the cheek and gum by sweeping the swab near the upper molar to the lower molar area.

Salivary Glands

Specimen Preparation:
1. Place swab into a test tube containing viral transport medium. The red top tube in the flu kit contains viral transport medium.
2. Label transport medium tube with the patient’s name and date of birth.
3. Enclose a completed MSDH Form 402 in outside flap of biohazard bag.
4. Refrigerate (do not freeze) the specimen until it can be shipped.

Specimen Shipping:
1. Ship specimen with an ice pack in a RIGID outer container (Styrofoam box or cooler). **DO NOT SHIP SPECIMENS IN AN ENVELOPE.**
APPENDIX H

BORDATELLA SPECIES PCR SPECIMEN COLLECTION PROCEDURE
Notify the Office of Epidemiology prior to shipping Bordetella PCR samples

Testing should be performed only on patients likely to have *B. pertussis* and as soon as possible after symptoms compatible with *B. pertussis* are exhibited by the patient. PCR positive rates will decrease over the two-week period following onset of symptoms. Therefore, sample collection is recommended for the following situations:

1. Patients who have symptoms compatible with pertussis (paroxysmal cough, whoop, apnea, and/or post-tussive vomiting) within two weeks and as soon as possible after onset of illness.

   OR

2. Any patient with an acute cough (any duration) and exposure to a case.

**Pertussis testing is not recommended for:**
3. Asymptomatic persons who have had contact with a pertussis case.
4. Patients with cold-like symptoms (sore throat, runny nose, sneezing, etc.) without a cough.

**SPECIMEN COLLECTION PROCEDURE**
*For best results, collect specimens prior to beginning antibiotic regimen.*

**Nasopharyngeal Swab (Preferred Specimen)**
1. Collect only one nasopharyngeal Dacron® or polyester tipped swab for each patient.
   
   Note: Swabs with calcium alginate or cotton tips and wooden shafts are NOT acceptable for PCR testing.
2. Immobilize the patient's head and gently pass the swab through the nostril into the nasopharyngeal cavity to the point of resistance; gently rotate. Do not direct the swab upward but allow the swab to glide along the floor of the nasal cavity. Do not force the swab past obstruction. See the diagram below.
   - Leave swab in place for 10-30 seconds.
   - Slowly remove with a circular motion.
3. Place swab into the provided 15 mL sterile conical tube or other sterile container with screw cap lid. The swab SHOULD NOT be placed into any transport media. Specimen should be immediately refrigerated (2-8°C) after collection and shipped on cold packs within 24 hours.
4. Label conical tube with patient’s name and date of collection.
Nasal Wash
1. Instill several milliliters of sterile saline into nostrils while patient’s head is tilted backward.
2. Bring patient’s head forward and catch saline from nostrils into a sterile container.
3. Pour at least 0.5 mL of specimen into a sterile, media-free urine cup/tube.
4. Label urine cup/tube with patient’s name and date of collection.

SPECIMEN SHIPPING
1. Each specimen must be accompanied by a completed MSDH test requisition Form 402.
2. Place a completed form in the OUTER pouch of the plastic biohazard bag containing an individual specimen. Do not place any paperwork in the inner pouch with the tube.
3. Ship specimen with an ice pack in a RIGID outer container (Styrofoam box or cooler). DO NOT SHIP SPECIMENS IN AN ENVELOPE.
Appendix J

INFLUENZA OR RESPIRATORY VIRUS PANEL SPECIMEN COLLECTION PROCEDURE

Nasopharyngeal Swab Collection (*Collect for both Influenza or Respiratory Virus Panel Testing*)
1. Prior to collection of the specimen, don the appropriate personal protective equipment.
2. Use only sterile Dacron® or synthetic swabs with wire shafts.
3. Place the patient’s head in an extended position.
4. Gently place the swab in the nostril.
5. Pass the swab through the nose until it contacts the nasopharyngeal walls.
6. Rotate the swab gently in place for 5 seconds to absorb secretions.
7. Withdraw the swab and insert into a tube containing at least 3mL of viral transport media/PBS. Break off or bend the end of the applicator shaft to close the tube tightly. Make sure that the tube is tightly sealed.
8. Label the tube with the patient’s name, specimen source, and date/time of collection.
9. Place specimen in a biohazard bag and store at 2-8°C until shipment.

Nasal Swab Collection (*Collect for Influenza testing only*)
1. Tilt patient’s head back 70 degrees.
2. While gently rotating the swab, insert swab less than one inch into nostril (until resistance is met at turbinates).
3. Rotate the swab several times against nasal wall and repeat in other nostril using the same swab.
4. Place tip of the swab into sterile viral transport media/PBS tube and cut off the applicator stick.
5. Label the tube with the patient’s name, specimen source, and date/time of collection.
   Place the specimen in a biohazard bag and store at 2-8°C until shipment.

Throat Swab Collection
1. VIGOROUSLY swab the areas highlighted in the figure. Swabbing may activate the gag reflex.
2. While holding the swab in your hand, unscrew the tube cap. Do not spill the tube contents. If using a swab without a breakpoint, carefully insert the swab into the tube and hold the swab just above the transport medium.
3. Break the shaft by bending it over the edge of the tube opening multiple times. Alternatively, cut the shaft with scissors decontaminating the blades with alcohol wipes between collections.
Transport

1. Ship specimen with an **ice pack** in a RIGID outer container (Styrofoam box or cooler). DO NOT SHIP SPECIMENS IN AN ENVELOPE.
2. Each specimen must be accompanied by a completed MSDH influenza test requisition Form 930. Place a completed form in the OUTER pouch of the plastic biohazard bag containing an individual specimen. Do not place any paperwork in the inner pouch with the tube.
3. On the day of collection, transport the specimen to the local health department for courier pick up. The MSDH courier will transport specimen to the MPHL.

*Do not submit multiple samples on the same patient.*
*Do not submit dry swabs for testing or swabs that were used for influenza rapid testing.*
APPENDIX K

CAPILLARY BLOOD COLLECTION PROCEDURE FOR BLOOD LEAD TESTING

Supplies Needed:
Lead-Free Microtainers, Lancets, Alcohol swabs, Sterile- gauze pads, Gloves

Specimen Collection Procedure
1. Lay out all of the supplies needed for a single collection.
2. Don a pair of disposable gloves that fit appropriately.
3. Seat the ambulatory patient in a standard phlebotomy chair with an arm board.
   a. For at-home visits, pediatric patients should sit in the lap of an adult and older children may sit in a chair with the arm extended over a table. The patient’s arm should be held as if he or she were seated at a miniature phlebotomy chair with an arm board. This position improves and optimizes the blood pressure in the fingertip and venous perfusion. Positions with the arm very much higher or lower than described tend to reduce or even stop the pressure at the fingertip and blood flow will be affected. When possible, the torso of supine (lying down with face upward) patients should be raised slightly and/or the arm lowered to a position slightly below the level of the breastbone.
4. Gently massage the entire length of the finger to increase the temperature and improve perfusion.
5. Clean the incision site and surrounding area with 70% isopropyl alcohol. Thoroughly dry the site with the sterile gauze pad to prevent rapid hemolysis caused by residual alcohol.
6. Again, gently massage the lower portion of the finger while avoiding the fingertip incision site. Firmly grasp the lower portion of the finger to restrict return circulation. Firmly position the lancet device at the incision site (refer to site selection instructions above) and depress the trigger.
7. After triggering, immediately remove the device from the patient’s finger. Using a sterile gauze pad, gently wipe away the first drop of blood. Apply gentle, continuous pressure to the finger avoiding excessive massaging as this may contaminate the sample or cause hemolysis.
8. After massaging the finger and forming a good drop of blood, touch the collector end of the container to the drop of blood. After collecting 2 or 3 drops, the blood will flow freely down the container wall to the bottom of the tube. Avoid excessive squeezing “milking” scooping or scraping. Fill as close to the 250 µL line as possible (200 µL minimum).
9. Replace cap on the microtainer. Gently invert to mix the blood well with the anticoagulant.
10. Following blood collection, gently press a dry sterile gauze pad to the incision site until bleeding stops. If indicated, apply a bandage to the finger.
APPENDIX L

VARICELLA-ZOSTER VIRUS PCR COLLECTION PROCEDURE

Swab Specimen Collection
1. Unroof a vesicle using a sterile 26 gauge needle.
2. Using a sterile Dacron® or synthetic-tipped swabs with a plastic shaft, scrub the base of the lesion vigorously enough to ensure that cells from the lesion are collected. Blood contamination is acceptable.
3. Place the swab into a 15 mL conical tube or a urine cup. Break or bend the swab shaft as necessary. DO NOT place specimen in transport medium.
4. Label the tube with the patient’s name and date/time of collection.
5. Place the specimen in a biohazard bag and enclose a completed MSDH Form 402 in outside flap of biohazard bag.

Scab Specimen Collection
1. If lesions have crusted over, lift the scab from the skin using the beveled point of a 26-gauge needle.
2. Transfer the scab to a sterile urine cup or suitable container. DO NOT place the specimen in transport medium.
3. Label the tube with the patient’s name and date/time of collection.
4. Place the specimen in a biohazard bag and enclose a completed MSDH Form 402 in outside flap of biohazard bag.

Specimen Transport
1. Specimens should be shipped to the laboratory at room temperature and dry.
2. Do not ship specimens on ice or place in transport media.
APPENDIX M

VACCINIA (NON-VARIOLA ORTHOPOX) PCR COLLECTION PROCEDURE

Swab and Scab Specimen Collection
1. Sanitize skin with alcohol wipe and allow to completely dry.
2. Open and remove the top of the lesion using a sterile scalpel or 26-gauge needle.
3. Place the vesicle or pustule skin “roof” in a dry, sterile 1.5-2 mL screw-capped plastic vial with O-ring.
4. Cap vial to maintain relative sterility and keep vial in as cool an environment as reasonably possible to preserve virus viability.
5. Using a sterile Dacron® or synthetic-tipped swabs with a plastic shaft, scrub the base of the lesion vigorously enough to ensure that cells from the lesion are collected. Blood contamination is acceptable.
6. Place the swab into a 15 mL conical tube or a urine cup. Break or bend the swab shaft as necessary. DO NOT place specimen in transport medium.
7. Label the tube with the patient’s name and date/time of collection.
8. Place the specimens in a biohazard bag and enclose a completed MSDH Form 402 in outside flap of biohazard bag.

Punch biopsy of lesion (if possible, obtain at least 2 separate lesions)
1. Use a 3.5- or 4-mm punch biopsy device to sample an entire lesion.
2. Bisect the biopsied material, using sterile scissors or scalpel.
3. Place half the biopsied material in formalin for histopathologic and immunohistochemical evaluation and keep at room temperature or above freezing (e.g., 2-8°C).
4. Place the other half of the biopsied material dry (do not add transport medium) in a sterile (1.5-2 mL) screw-capped plastic vial with O-ring.
5. Repeat procedure with at least one more lesion.

Specimen Transport
1. Specimen should be shipped to the laboratory on ice packs within 24 hours of collection.
APPENDIX N

QUANTIFERON® (TB EIA) COLLECTION PROCEDURE

Do not collect specimens on Friday unless correct incubation times can be assured. Please call the Immunology Lab at 601-576-7582 with any additional questions.

Required Collection Tubes Per Patient:
Nil Antigen tube (Grey cap), TB1 Antigen Tube (Green cap), TB2 Antigen (Yellow cap), Mitogen Tube (Purple cap)

1. Blood Collection
   a. Using standard venipuncture technique, draw 1 mL (0.8–1.2 mL of blood into each of the collection tubes (the black fill line on the side of the tube indicates the 1 mL fill mark).
   Note: Tube will fill slowly. Under or over-filling of the tubes outside of the 0.8 to 1.2mL range may lead to erroneous results.
   i. If a butterfly needle is being used to collect blood, a “purge” tube should be used to ensure that the tubing is filled with blood prior to specimen collection.
   b. Immediately after filling tubes, shake them 10 times just firmly enough to ensure the entire inner surface of the tube is coated with blood, to dissolve antigens on tube walls.
   c. Label each tube appropriately. Ensure each tube (Nil, TB1 Antigen, TB2 Antigen and Mitogen) is identifiable by its label once cap is removed.
   d. Complete the test requisition form.
   e. Maintain tubes at room temperature (22°C ± 5°C). Do not refrigerate or freeze the blood samples.

2. Incubation of Blood in Clinic
   a. If the blood is not incubated immediately after collection, re-mix the samples by vigorously shaking the tubes for 5 seconds immediately prior to incubation.
   b. Within 16 hours of collection, incubate the tubes UPRIGHT at 37ºC ±1ºC for 16 to 24 hours.
   c. Following the 37ºC ± 1ºC incubation, blood collection tubes should be received in the laboratory within 72 hours.
      i. Do not over incubate
      ii. Remove blood tubes from incubator after 16 to 24 hours and package for shipping.
      iii. Maintain tubes between 4°C and 27°C.
      iv. Do not centrifuge specimens before shipment.

3. Packaging and Shipping
   a. Place all four tubes into one biohazard bag.
   b. Place the completed lab request slip into the outside section of the biohazard bag.
   c. Tubes do not have to be kept upright after incubation.
   d. Do not ship on ice.
   e. Specimens should be shipped to the laboratory through the MSDH courier system using the approved plastic shipping tote provided by the lab.

4. Test Results
   a. Results will be sent to the county within 3 to 5 days.
   b. If results are not received within one week, call the District TB Coordinator for assistance.
Specimen Collection
The CDC recommends that a nasopharyngeal/throat swab and blood specimen be collected from all patients with clinical features compatible with measles. Urine specimens may also contain virus and, when feasible to do so, collection of both respiratory and urine specimens can increase the likelihood of detecting virus.

RT-PCR Testing
Collect both a respiratory swab AND a urine for each patient.

1. **Throat or nasopharyngeal swab** A throat swab is the preferred specimen:
   a. Collect swab as soon as possible after rash onset. Most successful when specimens are collected within 3 days of rash onset and a maximum of 14 days after rash onset.
   b. Use synthetic (non-cotton) swabs. Brands include Dacron® and Copan. This is the same type of swab used for influenza PCR testing.
   c. For a throat swab (preferred), swab tonsillar areas and posterior nasopharynx. Use a tongue blade to depress tongue to prevent contamination of the swab with saliva. For a nasopharyngeal swab, swab the nasal passage or the nasopharynx.
   d. Place the swab in 2-3 mL of standard, commercially available viral transport medium (VTM).
   e. Keep specimen(s) cold (4°C) and ship using ice packs.

2. **Urine:**
   a. Urine should be collected as soon as possible after rash onset. Have the patient void directly into the container collecting from the first part of the urine stream is possible. First morning voided specimens are ideal, but any urine collection is adequate.
   b. Collect 10-40 mL of urine in a sterile container.
   c. Keep specimens cold (4°C) and ship using ice packs

3. **Serologic testing:**
   a. Blood should be collected as soon as possible after rash onset.
   b. Collect 4-7 mL of whole blood in a red top or serum separator tube.
   c. Keep specimens cold (4°C) prior to shipment. Specimen must be received within 24 hours of collection.

4. **Specimen Testing:**
   a. Each specimen must be clearly labeled with the patient’s name, date of birth, and date of collection.
   b. Complete a MSDH Form 402 for each specimen collected. The patient information on the specimen tube must match the patient information on Form 402.
## APPENDIX P

### COVID-19 MOLECULAR TESTING SPECIMEN COLLECTION GUIDANCE

<table>
<thead>
<tr>
<th>Specimen Type</th>
<th>Collection options</th>
<th>Collection Process</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nasopharyngeal (NP) swab</td>
<td>Healthcare professional</td>
<td>Insert minitip swab with a flexible shaft (wire or plastic) through the nostril parallel to the palate until resistance is encountered or the distance is equivalent to that from the ear to the nostril of the patient, indicating contact with the nasopharynx. Swab should reach depth equal to distance from nostrils to outer opening of the ear. Gently rub and roll the swab. Leave swab in place for several seconds to absorb secretions. Slowly remove swab while rotating it. Specimens can be collected from both sides using the same swab, but it is not necessary to collect specimens from both sides if the minitip is saturated with fluid from the first collection. If a deviated septum or blockage create difficulty in obtaining the specimen from one nostril, use the same swab to obtain the specimen from the other nostril.</td>
</tr>
<tr>
<td>Oropharyngeal (OP) swab</td>
<td>Healthcare professional</td>
<td>Insert swab into the posterior pharynx and tonsillar areas. Rub swab over both tonsillar pillars and posterior oropharynx and avoid touching the tongue, teeth, and gums</td>
</tr>
<tr>
<td>Nasal mid-turbinate swab</td>
<td>Healthcare professional or supervised self-collection</td>
<td>Use a flocked tapered swab. Tilt patient’s head back 70 degrees. While gently rotating the swab, insert swab less than one inch (about 2 cm) into nostril (until resistance is met at turbinates). Rotate the swab several times against nasal wall and repeat in other nostril using the same swab.</td>
</tr>
<tr>
<td>Anterior nares/nasal swab</td>
<td>Healthcare professional or self-collection</td>
<td>Using a flocked/spun polyester swab or a round foam swab, insert the swab at least 1 cm (0.5 inch) inside the nostril (naris) and firmly sample the nasal membrane by rotating the swab and leaving in place for 10 to 15 seconds. Sample both nostrils with same swab.</td>
</tr>
<tr>
<td>Nasopharyngeal wash/aspirate or nasal wash/aspirate</td>
<td>Healthcare professional</td>
<td>Attach catheter to suction apparatus. Have the patient sit with head tilted slightly backward. Instill 1 mL-1.5 mL of non-bacteriostatic saline (pH 7.0) into one nostril. Insert the tubing into the nostril parallel to the palate (not upwards). Catheter should reach depth equal to distance from nostrils to outer opening of ear. Begin gentle suction/aspiration and remove catheter while rotating it gently. Place specimen in a sterile viral transport media tube.</td>
</tr>
</tbody>
</table>

### Swab Specimen Requirements:
- All swabs must be placed immediately after collection into a sterile transport tube containing 2-3mL of either viral transport medium (VTM), a Universal Transport Medium appropriate for viruses Amies transport medium, or sterile saline.
- Swabs must be sterile. If the applicator handle requires additional trimming, the trimming should be performed with a sterile pair of scissors to prevent contamination of the sample.
- Do not use calcium alginate swabs or swabs with wooden shafts, as they may contain substances that inactivate some viruses and inhibit PCR testing.
Nasal wash/aspirate Requirement:
• The NW specimen and the non-bacteriostatic saline used to collect the specimen should be placed immediately into a sterile transport tube.

Specimen Handling:
• Refrigerate all specimen types at 2-8°C after collection and up to 72 hours after collection. If a delay in testing or shipping is expected, store specimens at -70°C or below.
• Label each specimen container with the patient’s first and last name, patient’s date of birth, specimen date of collection, and specimen type.
• Complete the MSDH SARS-CoV-2 test requisition (form 1198). The requisition and the specimen container must have matching information for the patient’s name and date of birth to be acceptable.

APPENDIX R

DRINKING WATER FLUORIDE SAMPLE COLLECTION GUIDE

A. Split Sample Collection:

Use bottles provided by the MSDH only.

![Image of sample collection bottle]

- Do not use a bottle if the shrink-wrap has been tampered with or removed.
- Obtain additional bottles from the local County Health Department
- It is normal for a small amount of white powder or clear moisture to appear on the inside of the bottle. This is sodium thiosulfate. DO NOT RINSE THE BOTTLE PRIOR TO COLLECTING THE SAMPLE.

1. Collect sample from entry point unless your MSDH regional engineer has instructed you to collect from a different location.
2. Flush the line to clear it of any debris.
3. Grab a sample in a clean container large enough to fill the sample bottle to the fill line and to complete the field test.
4. Allow the sample to reach room temperature or to reach the same temperature as your de-ionized (DI) water.
5. Using your field test kit, analyze a small amount of the sample.
6. If the result is within optimal range record the field result in the appropriate blank on the form 428.
7. If result is out of range, check your equipment settings and fluoride chemicals, and repeat steps 1 - 6.
8. Once the field sample result value is found to be in range pour the sample into the 100 ml plastic sample bottle. Fill just slightly above the “fill line” and secure the cap.
9. Turn bottle upside down to assure bottle is properly sealed.

B. MSDH Form 428 Instructions

![Image of Form 428]

- Do not use a bottle if the shrink-wrap has been tampered with or removed.
- Obtain additional bottles from the local County Health Department
- It is normal for a small amount of white powder or clear moisture to appear on the inside of the bottle. This is sodium thiosulfate. DO NOT RINSE THE BOTTLE PRIOR TO COLLECTING THE SAMPLE.

- Fill just slightly above the “fill line” and secure the cap.
- Turn bottle upside down to assure bottle is properly sealed.

MSDH RESULTS          MG/L
(LAB USE ONLY)          Place Barcode Label Here.
1. Place an “X” in the box that corresponds to the type of sample you are collecting (split or other).

[ ] Split Check Split box for all samples taken to meet monthly fluoridation sampling requirements and required resamples.
[ ] Other Check Other box for all monitoring, complaints, and when instructed by MSDH.

2. Enter the Name of the System, the 7 digit (i.e. 0010001) public water supply ID number (PWSID) and the entry point/well location. Please skip these fields when using MSDH-provided barcode.

3. Enter the first and last name of the individual collecting the sample in the “Collected by” blank.

4. Enter the date the sample was collected. Ex: 03/15/2020.

5. Enter the field result in the blank. Ex: __0.8___mg/L

6. Use the comment field only if needed.

7. Do not write below the FOR LAB USE ONLY line. This space is for laboratory reporting of results in the event electronic/printed reports are not available.

C. Barcode Label Placement, Box Custody/Integrity Seal and Address Label and Sample Submission

1. Use barcode labels provided by the Bureau of Public Water Supply which specify your PWSID, system name, and entry point. Each entry point will require 3 labels (a B, F and S label) or one row of labels. Two rows of barcode labels (one row of labels have been used and is empty) are shown below. The barcode number (located in the square below) will be the same for all labels in a row.

2. Remove the labels from left to right across the page.

3. Place Label “B” on your sample bottle. (B is red on the label)

4. Place Label “F” on your Form 428 in the box in the lower righthand corner. (F is red on the label)

5. Place Label “S” on your yellow copy of Form 428 and retain for your records. (S is blue on the label)

6. The number below the barcode on the bottle matches the number below the barcode on the Form 428. If the bottle label and the form label do not match, the lab must reject the sample.

7. Place your sample(s) in the 2, 6 or 12 pack boxes that are provided by MSDH through your county health department. Place completed Form 428 on top of the bottle.

8. Repeat this process for each sample you have collected.

9. After placing your samples in a box, affix two signed and dated QEC custody/integrity seals to each box submitted.
a. For the 6 or 12-pack box, place one signed and dated custody/integrity seal on the top seam and one signed and dated custody/integrity seal on the bottom seam of the box. When a previously used custody/integrity seal is already applied to the bottom of the 6 or 12-pack shipping box, draw a single line through the seal with a marker.

b. For the 2-pack box place a signed and dated custody/integrity seal across both of the two (top) side seams on the box (see picture 3).

c. Affix a MSDH Public Health Laboratory address label to each box (see picture 4). Make sure that the address label does not cover your signature and date on the custody/integrity seals. Address labels are available at the local county health department. Do NOT rely on county health department staff to affix the address label.

10. Use only clear shipping tape to seal the sample box and to cover the custody/integrity seals.
11. Submit the samples to your county health department. Be sure to log samples in the county log books.
12. Sample bottles, boxes, Forms 428, custody/integrity seals, and address labels are available at the County Health Department. **Barcode labels must be ordered from the Bureau of Public Water Supply.**
13. **DO NOT leave samples to be boxed by county personnel.** You are responsible for packaging and labeling all your samples.
14. Failure to follow these instructions will cause your samples to be rejected.

*If you do not have any MSDH Barcode labels or have any questions, please contact the Bureau of Public Water Supply at 601-576-7518 immediately.*
APPENDIX S

DRINKING WATER MICROBIOLOGY (BACT) SAMPLE COLLECTION GUIDE

A. Sample Collection:

Use bottles provided by the MSDH only.

- Do not use a bottle if the shrink-wrap has been tampered with or removed.
- Obtain additional bottles from the local County Health Department
- It is normal for a small amount of white powder or clear moisture to appear on the inside of the bottle. This is sodium thiosulfate and is required for the process.
- **DO NOT RINSE THE BOTTLE PRIOR TO COLLECTING THE SAMPLE**

1. Start by selecting an outside faucet (one that is on the public water system site plan if this is a Routine sample).
   - If the faucet is leaking, select another outside faucet (one that is on the public water system site plan if this a Routine sample).
2. Flush the distribution line.
3. Torch the faucet.
   - If a torch is not available, then use an isopropyl alcohol swab to clean the inside of the faucet.
4. Flush the faucet.
5. Adjust the faucet to a slow steady stream.
6. Wear gloves when collecting samples.
7. **DO NOT** rinse the bottles.
8. Take your time and make sure not to contaminate the bottle or cap.
9. Carefully remove the shrink-wrap and the cap.
10. **DO NOT** touch the neck of the bottle, the inside areas of the bottle, or inside the cap.
11. Continue holding the cap by its outside edges only.
12. Place the bottle underneath the stream of water.
13. Fill the sample bottle to just above the fill line.
14. **DO NOT** fill to the neck of the bottle.
   - If the bottle is over-filled, throw it away.
   - Obtain a new bottle and fill to the proper level.
15. Place the cap on the bottle immediately. Do not over-tighten.
16. Turn bottle upside down to make sure the cap is securely fastened.
B. MSDH Form 425 Instructions for Drinking Water Microbiology Sample

Check the box associated with the type of sample you are collecting (routine, resample, boil water, monitoring, other) as defined below.

- **Routine**: Check **Routine** box for a sample collected to meet monthly sampling requirements.
- **Resample**: Check **Resample** box for a sample collected after a TC+ or EC+ sample or if instructed by MSDH. Record MSDH assigned resample code for distribution samples.
- **Boil Water**: Check **Boil Water** box for samples collected to clear a boil water notice event.
- **Monitoring**: Check **Monitoring** box for samples collected for customer complaints, new line checks, construction, putting a tank back in service or for samples that should not be used for compliance. Use to clear a well.
- **Other (MPN)**: Check Other box when requesting a MPN (coliform enumeration). Must contact MSDH Bureau of Public Water Supply at 601-576-7518 prior to collection.

1. Enter the Name of the System and the 7 digit (i.e. 0010001) public water supply ID number (PWSID). Please leave blank if using a MSDH-provided barcode that provides information.
2. Enter sample location that corresponds to your microbiological sample site plan if collecting routine or resamples and the 911 address or descriptive location for all other samples.
3. Enter the first and last name of the individual collecting the sample.
4. Enter the date and time collected. **Circle AM or PM**.
5. **Please enter both free and total chlorine residual**.
6. Do not write below the FOR LAB USE ONLY line. This space is for laboratory reporting of results in the event electronic/printed reports are not available.

C. Barcode Label Placement, Box Custody/Integrity Seal and Address Label and Sample Submission

Use barcode labels provided by the Bureau of Public Water Supply which specify your PWSID and system name. Each sample will require 3 labels (a B, F and S label) or one row of labels. Four rows of barcode labels (one row of labels have been used and is empty) are shown below. The barcode number (located in the square below) should be the same for all labels in a row.
Call the Bureau of Public Water Supply at 601-576-7518 to order more barcode labels before you have exhausted your supply. Please do not run out of barcode labels.

1. Remove the labels from left to right across the page, starting with the B label and ending with the S label.
2. Place Label “B” on your sample bottle. (B is red on the label)
3. Place Label “F” on your Form 425 in the box in the lower right-hand corner. (F is red on the label)
4. Place Label “S” on the yellow copy of Form 425 and retain for your records. (S is blue on the label)
5. The number below the barcode on the bottle must match the number below the barcode on the Form 425. If they do not match, the lab must reject the sample.
6. Place the sample bottles in the shipping box. Place the Form 425 on top of the bottles.
7. Repeat this process for each sample you have collected.
8. Place your sample(s) in the 2 or 12 pack boxes that are provided by MSDH through your county health department.
9. Affix two signed and dated QEC custody/integrity seals to each box submitted.
   a. For the 12-pack box place one signed and dated custody/integrity seal on the top seam and one signed and dated custody/integrity seal on the bottom seam of the box. When a previously used custody/integrity seal is already applied to the bottom of the 12-pack shipping box, draw a single line through the seal with a marker.
   b. For the 2-pack box place a signed and dated custody/integrity seal across each of the two (top) side seams on the box.
c. Affix a MSDH Public Health Laboratory address label to each box. Make sure that the address label does not cover your signature and date on the custody/integrity seals. Address labels are available at the local county health department. Do NOT rely on county health department staff to affix the address label.

10. Use clear shipping tape to seal the sample box and to cover the custody/integrity seals.
11. Submit the samples to your county health department. Be sure to log samples into county logbooks.
12. Sample bottles, boxes, Form 425, custody/integrity seals, and address labels are available at the County Health Department. **Barcode labels must be ordered from the Bureau of Public Water Supply.**
13. **DO NOT leave samples to be boxed by MSDH county clinic personnel.** You are responsible for packaging and labeling all your samples.
14. Failure to follow these instructions will cause your samples to be rejected.

**If you do not have any MSDH Barcode labels or have any questions, please contact the Bureau of Public Water Supply at 601-576-7518 immediately.**
APPENDIX T

HOW TO DELIVER LOCAL SAMPLES TO THE DR. F.E. “ED” THOMPSON, JR.
PUBLIC HEALTH LABORATORY
Monday – Friday, 8:00 a.m. – 4:30 p.m.

1. Go west on Woodrow Wilson past North State Street. Turn into the 2nd MSDH entrance off Woodrow Wilson Drive. A sign in front of the entrance states “MSDH Laboratory Deliveries Dock”.

2. Drive to the end of the driveway and park in 1 of the 2 parking spaces directly in front of the closed gates to the MSDH garage. After exiting your vehicle, walk towards the building dock (located directly behind you). Continue walking into the dock area until you see stairs to the right.

3. Walk up the stairs. At the top of the stairs, you will see the sample receiving door.
4. Press the white call button next to the door to notify the MPHL front desk that you have samples to deliver. The front desk staff will remotely open the door.
5. After entering room, place sample(s) inside either a clinical services (patient samples) or an environmental services (drinking water) locker. Clinical services lockers are labeled as C1-C18. Environmental Services lockers for smaller drinking water samples are labeled as E1-E18. A separate locker is available for larger drinking water samples. Locks for the small lockers are located in the yellow lockout station. Locks for the large lockers are already hanging in the locker doors.

6. After placing your sample in the appropriate locker, remove a lock from the yellow lockout station. Insert a lock into the locker door and push lock close. **Do not leave samples in an unlocked locker or unattended outside a locker.**

7. Record your delivery on either a clinical services (patient samples) or environmental services (drinking water samples) log located on the table next to the door. MPHL test requisitions and drinking water testing supplies are available on the shelf across from the table. **If your sample is too large to fit in a locker or if you have a question regarding testing, use the phone located on the table to call 601-576-7582 for assistance.**
